HMIS 2020-21 & 2021-22 (An Analytical Report)

सत्यमेव जयते

आज़ादी का
अमृत महोत्सव

FOREWORD

The rapid progress in Public Health over the years and especially during the pandemic and post pandemic period under National Health Mission, MoHFW has proven that our country's healthcare infrastructure can withstand such adverse conditions.

Health Management Information System (hmis.nhp.gov.in) of Ministry of Health & Family Welfare is operational since 2008 and is an exclusive source of regular information for facility level health data nationwide. The huge amount of data that is available through HMIS of our country is a great support for Policy formulation and Planning in Health. HMIS data is exclusively used for Monitoring of various health programmes/ schemes under NHM.

"HMIS 2020-21 & 2021-22 An Analytical Report" is based on analysis of data uploaded by States/ UTs on the HMIS portal. Analysis of the collected data enables us to assess whether and how our program has achieved its objectives. HMIS data informs government about health status of country and eventually helps in evidence based decisions making and is a source for mid-term course corrections too. This publication provides an insight into various major programmes of NHM being implemented and run in the country currently by MoHFW.

I am sure that this publication would provide valuable support to the users and will serve as a tracker to the growth of the various programmes and schemes of NHM. Any suggestions/comments for improving the contents and layout of the publication will be highly appreciated.

Date : 30 December, 2022

Acknowledgement

The Health Management Information System (HMIS) is a web based portal for Monitoring of various programmes under National Health Mission (NHM) and other national health programmes. **"HMIS 2020-21 & 2021-22 An Analytical Report"** has been prepared on the basis of the National Health Mission data reported through HMIS by around 2.25 lakh health facilities from all States/UTs during the financial year 2020-21 and 2021-22

The report covers the introduction of HMIS 2.0, its genesis and new features. Analysis of data related to various programmes under RCH viz. Maternal Health, Child Health, Family Planning, Immunization, Adolescent Health, Patient Services, Diagnostic Service – Lab & Radiology has been done in detail. This time the publication is also providing a comparative analysis of various parameters for two financial years. The publication is bought out for the second time now.

This would be the right place to mention that the HMIS data is being actively utilised to monitor the implementation of Programme Implementation Plan (PIPs) of States/ UTs, monitoring the delivery of services to beneficiaries under various health schemes funded by GoI, Grading/ Ranking of health facilities, as a conditionality framework for incentive or dis-incentive under NHM, monitoring of aspirational districts, State health index, DH ranking, PM Dashboard (Prayas), Data.Gov.in, Rural Health Statistics, Monitoring of Aspirational Districts and Low performing districts (Mission UTKARSH) etc.. The Monitoring visits such as CRM, supportive supervision visits also uses HMIS data. The analytical reports generated through HMIS also provides gap analysis and evidence based course correction.

I duly acknowledge the valuable contribution of the National HMIS team under overall guidance of Ms. Anjali Rawat, DDG (Stats), Shri Anindya Saha, DD (Stats) and all HMIS Consultants in bringing out of this publication.

PROLOGUE

Health Management Information System (HMIS) is the central MIS system of Ministry of Health and Family Welfare. HMIS data serves as important data repository to MoHFW as well as all the stakeholders working in the field of Health.

The HMIS annual report is based on the analysis of HMIS data for 2020-21 and 2021-22. This is an attempt to provide the comprehensive data on various Health indicators in one report.

The current publication consists of 10 chapters based on the thematic areas related to health. Chapter 1 introduces HMIS, its journey, magnitude of data collection, Key features of HMIS 2.0, data captured in HMIS, Categorization of facilities, available in HMIS, details about the data quality measures adopted in HMIS. Chapter 2 provides details about Reproductive, Maternal, Newborn, Child and Adolescent Health (RMNCH+A) with details on Maternal Health related indicators performance. Chapter 3 details about the indicators of Child Health like HBNC, NRC, Early Initiation of Breast feeding, Low Birth Weight Infant (<2.5 Kg), Pre-term (High Risk) babies, SNCU, RBSK along with the Still Birth Rate, Sex Ratio, Infant and Child Mortality. Chapter 4 provides information about indicators related to immunization programme with respect to full immunization of Pregnant Women and Children, coverage Measles, Rubella, OPV-0, Hept-B, Pentavalent, Rotavirus vaccine and AEFI. Chapter 5 provides information about unmet need, Key Data Elements for Family Planning under HMIS, Antara Programme, IUCD, PPIUCD, male and female sterilizations and coverage of other spacing methods like OCPs, and Condoms.

Chapter 6 provides indicators performances related to Adolescent Health programme, Number of boys and girls registered in AFHC, Adolescents receiving Clinical and Counselling services at AFHC, WIFS, School Health and Wellness Programme, Menstrual Hygiene Programme. Chapter 7 provides information about various Diagnostics services under Lab and Radiology like Lab Test and OPDs/IPD, Ultrasound, X-Ray, HV Test, ICTC, malaria test, Widal test and Syphilis Tests. Chapter 8 provides information about FRUs, essential criteria for FRUs, Current Status of FRUs along with its coverage as per the facilities. Chapter 9 provides information about Patient Services Utilization, OPD, IPD, OPD per facility type, OPD Services per Doctor per year at Public Health Facilities, Lab Tests per and Lab Technician at Public Health Facilities. Chapter 10 provides information about An Analysis of HMIS Data on District Hospitals

I am greatly indebted to my colleagues from different State/UTs who have uploaded the information on HMIS web portal in time. I wish to thank all the Officers of Statistics Division of MoFHW, including Mr. Anindya Saha, Deputy Director (Statistics) and all HMIS Consultants in analysing HMIS data and preparing this analytical report and making possible to publish this report.

(Anjali Rawat)

OCPs: Oral Contraceptive Pills
OGTT: Oral Glucose Tolerance Test
OPV Oral Polio Vaccine
PCPNDT: Pre-Conception and Pre-Natal Diagnostic Techniques
PCV: Pneumococcal Conjugate Vaccine
PHC: Primary Health Centre
PIP: Programme Implementation Plan
PNC: Post Natal Care
PPIUCD: Postpartum Intrauterine Contraceptive Device
PPS: Post-Partum Sterilization
PRCs: Population Research Centre
PTK: Pregnancy Test Kits
PVV: Rotavirus vaccine
QOC: Quality Of Care
RBSK: Rashtriya Bal Swasthaya Karyakram
RCH: Reproductive and Child Health
RDA: Recommended Dietary Allowances
RKS: Rogi Kalyan Samiti
RKSK: Rashtriya Kishor Swasthya Karyakram
RPR: Rapid Plasma Reagin
SAM: Severe Acute Malnutrition
SAS: Statistical Analysis System
SBA: Skilled birth attendant
SBR: Still Birth Rate
SC: Sub Centre
SDG: Sustainable Development Goals
SDH: Sub District/ Divisional Hospital
SNCUs: Sick Newborn Care Units
SRS: Sample Registration System

STD: Sexually Transmitted Disease
TFR: Total Fertility Rate
UIP: Universal Immunization Programme
ULB: Urban Local Body
UTs: Union Territories
VDRL: Venereal Disease Research Laboratory
VLBW: Very Low Birth Weight
WIFS: Weekly Iron folic acid

CHAPTER 1

INTRODUCTION

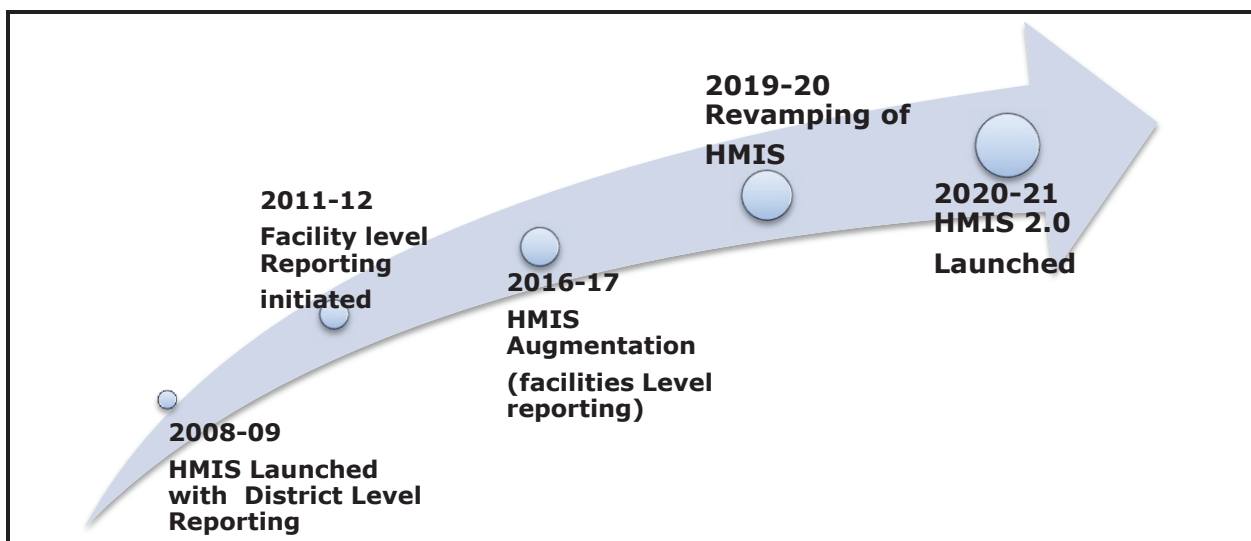

Health Management Information System (HMIS) is a web-based Monitoring Information System of Ministry of Health & Family Welfare to monitor the National Health Mission, and other various other National Health Programmes of the Ministry. It provides key inputs for policy formulation and appropriate programme interventions. HMIS is designed specifically to assist health departments, at all levels, in managing, planning, and monitoring and evaluation of the health programmes currently running in the country.

Considering the outdated software and hardware technologies of the existing HMIS portal and various technological requirements such as API, Real time dynamic reporting, interactive dashboard etc., revamping of the existing HMIS application was felt need. Therefore, the HMIS 2.0 was developed and launched in 2020.

1.1 Journey of HMIS

HMIS 1.0 started functioning from 2008-09 with District level reporting. Gradually, facility level data entry initiated during 2011-12 and it was completed by 2016-17. Due to technological and programme need, HMIS revamping was initiated in 2019-20 and further launched in December 2020. The details Journey of HMIS is given in Fig 1.1.

Figure 1.1: Journey of HMIS

Health Management Information System (HMIS) 2.0 is a step towards digital transformation of health services delivery in the country. During 2016-17 and 2020-21, Digital India award also received for open data domain category.

1.2 Magnitude of Data Collection

There are five types of formats available in HMIS to capture data from health facilities which include, Sub Centres (SCs), Primary Health Centres (PHCs), Community Health Centres (CHCs), Sub-District Hospitals (SDHs) and District Hospitals (DHs) across the country. As of March 2022, there were around 747 districts and around 2.17 lakh health facilities mapped and reporting through HMIS Portal.

1.3 Key features of HMIS 2.0

Data Entry:

- All types of public health facilities and private hospitals are mapped either as SC/PHC/CHC/SDH/DH and based on this mapping, set of data items for which data has to be filled are generated.
- Person Specific User Credentials (mapped to an Individual)
- Flexible: Data for multiple facilities can be entered through one credentials or one facility with one credential – as per requirement of the administrative units of States
- Compatibility with multiple devices (Mobile, Tab etc.)
- The users can enter data regarding availability of infrastructure and human resources at the facility only once in the system with an option to auto populate the same on a monthly basis. However, data can be edited as and when changes are required.
- Inbuilt Consistency check for Data Quality i.e. inter-data validation, comparison with data reported in the previous months etc.
- Offline bulk upload options for health facilities having not so good internet connectivity
- State –specific hierarchy was developed

Integration with other Systems:

- Linkage through API with other national level portal of Ministry of Health & Family Welfare, Ministry of Rural Development, Ministry of Tribal Affairs etc.

- State specific generic API for fetching data from State MIS portal (like PCTS portal of Rajasthan)

Reporting:

- Provisioning for real-time monitoring, Alerts, Analytics GIS Integration with layers up to road, village boundary etc.
- Data Visualization through GIS and Interactive Dashboard
- Standard reports in public domain and real time reports in login available. Real time reports include data reporting status, all data items report, Key HMIS report, Min-Max, Range report etc.

1.4 Data Captured in HMIS

Data related to Service Delivery and Infrastructure/ Human Resource is captured in HMIS on monthly basis. Data for Service Delivery is to be entered every month by 5th of the following month. The data for Infrastructure/ Human Resource is also entered on monthly basis. Various modules for which data is captured in HMIS are as follows:

Service Delivery:

- Maternal Health, Child-health & Immunization, Family Planning,
- Vector Borne Disease, Tuberculosis, Morbidity and Mortality,
- OPD, IPD Services, Surgeries etc.

Infrastructure:

- Manpower, Equipment,
- Cleanliness, Building,
- Availability of Medical Services such as Surgery etc.,
- Super Specialties services such as Cardiology etc.,
- Diagnostics,
- Para Medical and Clinical Services etc.

1.5 Health Facilities Status

In all, there are around 2.17 lakh health facilities reported service delivery data on HMIS as on March 2022. All India distribution of health facilities by type is given in Figure 1.2.

Figure 1.2: All India Mapping Distribution of Health Facilities by type of Formats

The State/UT-wise breakup of Public Health Facilities by facility type as mapped in HMIS and Private Health Facilities by facility type as mapped in HMIS distribution as on 31st March 2022 are provided at **Annexure-1.1 and Annexure-1.2**

1.6 Categorization available in HMIS

Facility Categories:

As mentioned earlier in HMIS, the data is captured broadly on 5 types of formats i.e. SC, PHC, CHC, SDH and DH. However, on ground there are many varied facility sub types or attributes to a facility for which demarcation is required. Accordingly, the following categorization is available on HMIS:

1. Services Category: 24X7, FRU, PPP, fully IPHS compliance, Other equivalent
2. Sub Facility Type: Medical College (For DH &SDH), & Health & Wellness Centre (For PHC & SC)
3. Certifications obtained - NQAS, Kayakalp, & LaQshya
4. Funding Pattern: Funded by NUHM
5. Ranking / Grading exercises: To be Graded/Ranked
6. Administrative control: Under Civil Surgeon Admin, Under District Health Officer (DHO) Admin), State PHD administered Facilities, ULB Administered Facilities.
7. Medical Specialty - Single specialty, Multi-specialty, AYUSH, MMU, Delivery Point

8. State specific health facility/nomenclature- Boat Clinic, Dispensary, Health Unit, Standalone DH/SDH, Teaching Hospitals, Mohalla Clinic.
9. Governing Agency - Central Govt., Railways, Defense, ESI, 15th Finance Commission (FC-XV).
10. Report: Under Health Statistics for RHS Report.

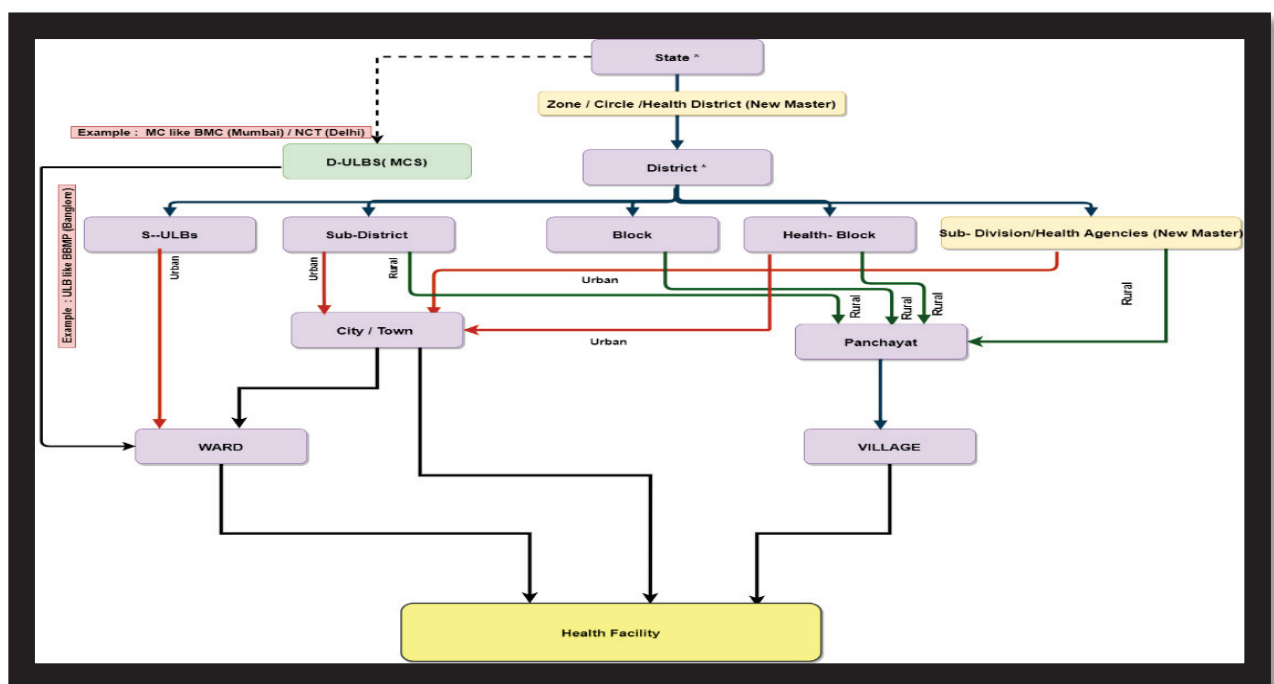

1.7 State Specific Hierarchies (Geographical)

Although the HMIS system is LGD Compliant, i.e. it follows a standard hierarchy as listed in LGD for State, District and Sub District, but as per the state's requirement, a provision has been created for incorporating state specific hierarchies below the level of sub district. The additional levels provided in HMIS are:

1. Urban Local Body (ULB) at State as well as District Level
2. Health Block
3. Sub Division / Health Agency
4. City Town

The details the generic structure of the State specific Hierarchies is given below in Fig 1.3.

Figure 1.3: Generic Structure of the State Specific Hierarchies

1.8 Reporting in Service Delivery format by Public Health Facilities

Of 2.17 lakh health facilities, there were around 99.8% reporting at all India level by all the health facilities for service delivery format. Only Delhi and Lakshadweep has a reporting below 90 percent in March 2022. The details of all States reporting of Service delivery is given at Fig 1.4.

Figure 1.4: State/UT wise percentage distribution of reporting of monthly Service Delivery data as on 31st March 2022

1.9 Data Quality Assurance in HMIS

Data quality is defined as the degree to which the data fulfills its intended purpose. The volume of data, which HMIS generates, requires good Data quality assurance mechanism. Accordingly, a comprehensive Data Quality Assurance mechanism is in place in HMIS. Ministry give top priority to quality of data coming into HMIS.

Data reported in HMIS is expected to fulfill the various dimension of data quality. These dimensions include timeliness, completeness, consistent and correctness. To ensure timeliness, each facility is expected to enter the data by fifth day of the following month.

HMIS has placed validation rules in data entry formats to ensure data quality. There are some inbuilt data quality mechanism and some external data quality mechanism in place.

i. Inbuilt Data Quality Assurance Mechanism

The inbuilt data quality assurance mechanism in place includes following:

- a. Compare Option (available in data entry screen)
 - b. Inter-Data Validation Checks (available in data entry screen)
- a. Compare Option: HMIS has inbuilt features under which during the time of data entry, data entry user can compare the entry of present month with that of previous month. That way they can observed any adverted mistake or outlier data entry in the system. Screenshot of same is given below at Fig 1.5.

Figure 1.5: Compare option in HMIS

Part-A M1	Part-A M2-M4	Part-A M5-M7	Part-A M8	Part-A M9	Part-A M10-M11	Part-A M12-M13	Part-B M14	Part-B M15	Part-C M16	Part-C M17	Indicator Name	Sep-2022	Oct-2022	Remarks
Part A														
M1														
Ante Natal Care (ANC) Services														
1.1	Total number of pregnant women registered for ANC											38		
1.1.1	Out of the total ANC registered, number registered within 1st trimester (within 12 weeks)											29		
1.2														
ANC services														
1.2.1	Number of PW given TT1/ Td1											26		
1.2.2	Number of PW given TT2 / Td2											15		
1.2.3	Number of PW given TT Booster/ Td Booster											12		
1.2.4	Number of PW provided full Course 180 Iron Folic Acid (IFA) tablets											30		
1.2.5	Number of PW provided full Course 360 Calcium tablets											18		
1.2.6	Number of PW given one Albendazole tablet after 1st trimester													
1.2.7	Number of PW received 4 or more ANC check ups											29		
1.2.8	Number of PW given ANC Corticosteroids in Pre Term Labour													
1.3														
Pregnant women (PW) with Hypertension (BP > 140/90)														
1.3.1	New cases of PW with hypertension detected											2		

b. Inter-Data Validation Checks:

HMIS has inbuilt data validation rules in place in its various data entry formats which restrict users from entering any garbage value in the system – some of the rules are 'mandatory' while the others are in terms of 'warning'. Mandatory validation rules are those which are having direct parent-child relations such as no. of 1st trimester registration of pregnant women cannot be greater than No. of ANC registration. A screenshot of the same is given below in Fig 1.6. Similar to these, there are some other mandatory validation rules inbuilt in HMIS.

Figure 1.6: Inbuilt validation rules sample in place in HMIS

The screenshot displays the HMIS (Health Management Information System) interface. At the top, there is a navigation bar with options like 'HMIS', 'Data Entry', 'Reports', 'View Map', 'Download', and 'Publications'. A prominent error message box is overlaid on the page, stating: "Error!! Out of the ANC registered, number registered with in 1st trimester(Within 12 weeks) <= Total number of pregnant women registered for ANC". Below the error message, there is a table for data entry. The table is titled "Monthly Service Delivery" and includes a "Reporting Month" dropdown set to "Sep-2022". The table has columns for "Indicator Number", "Indicator Name", and "Remarks". The data entry form shows the following indicators and their values:

Indicator Number	Indicator Name	Value	Remarks
M1	REPRODUCTIVE AND CHILD HEALTH		
M1	Ante Natal Care (ANC) Services		
1.1	Total number of pregnant women registered for ANC	38	
1.1.1	Out of the total ANC registered, number registered within 1st trimester (within 12 weeks)		
1.2	ANC services		
1.2.1	Number of PW given TT1/Td1	26	

ii. External Data Quality Assurance Mechanism

The external data quality assurance mechanism, which includes reports such as min-max report, Real time data reporting status etc. through which completeness of reporting as well as any data quality related issues can be detected. In addition, there is an automated tool developed through which data quality can be assessed by the users. The tool is called as ADVTool.

a. The ADVTool:

Ministry in collaboration with National Institute of Medical College, ICMR and Population Council developed an automated data quality tool as part of National Data Quality Forum

(NDQF) support. The data quality thus developed tested and piloted. It is also available on HMIS portal also.

The ADVTool is an automated system, is an effort in this direction to enable HMIS staff in faster review of errors and finalization of HMIS data. The system will benefit the staff working at the national and sub-national levels to undertake data quality assessment checks and provide feedback to data entry operators at facility levels.

iii. Training and Capacity Building:

HMIS has a robust regular training and capacity building annual plan. One national and three to four regional workshops are held every year as per the plan. During 2020-21 and 2021-22, due to Covid-19 pandemic, number of virtual workshops were held where States/UTs and Districts HMIS nodal were oriented on HMIS. These workshops are organized to orient about new features and data definition.

iv. Supportive Supervision:

Supportive supervision and monitoring visits are important part of data quality verification. During the field visit random checks of HMIS data in the registers at facility level is undertaken. During Common Review Mission of National Health Mission HMIS data is extensively used during field visits. Population Research Centre (PRCs) are also involved in the data verification exercise of the HMIS data.

Annexure 1.1

State/UT-wise number of Public Health Facilities by type of health facility as mapped in HMIS (As on 31st March 2022)

Sl. No.	States/UTs	Health Sub Centre	Primary Health Centre	Community Health Centre	Sub District Hospital	District Hospital	Total
All India		162652	32281	6217	1407	1070	203627

CHAPTER 2

REPRODUCTIVE, MATERNAL, NEWBORN, CHILD AND ADOLESCENT HEALTH (RMNCH+A)

Introduction

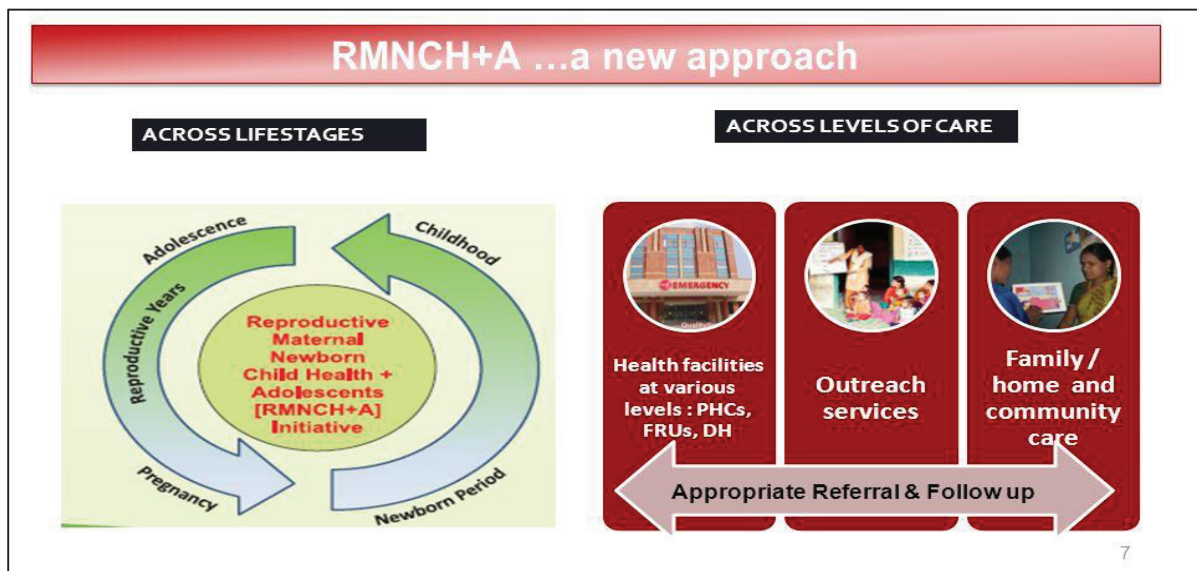

The Reproductive and Child Health (RCH) Programme was launched throughout the country on 15th October, 1997.

This programme aimed at achieving a status in which women will be able to regulate their fertility, women will be able to go through their pregnancy and child birth safely, the outcome of pregnancies will be successful and will lead to survival and well-being of the mother and the child. The couples will also be able to have their sexual relation free from fear of pregnancy and of contracting sexually transmitted diseases.

The second phase of RCH program i.e., RCH – II was launched on 1st April, 2005. The main objective of the program was to bring about a change in mainly three critical health indicators i.e., reducing total fertility rate, infant mortality rate and maternal mortality rate with a view to realizing the outcomes envisioned in the Millennium Development Goals.

RMNCH+A approach has been launched in 2013 and it essentially looks to address the major causes of mortality among women and children as well as the delays in accessing and utilizing health care and services.

Figure 2.1: The RMNCH+A strategic approach

The RMNCH+A strategic approach has been developed to provide an understanding of '**continuum of care**' to ensure equal focus on various life stages. Priority interventions for each thematic area have been included in this to ensure that the linkages between them are contextualized to the same and consecutive life stage. It also introduces new initiatives like the use of Score Card to track the performance, National Iron + Initiative to address the issue of anaemia across all age groups and

the Comprehensive Screening and Early interventions for defects at birth, diseases and deficiencies among children and adolescents.

The RMNCH+A appropriately directs the States to focus their efforts on the most vulnerable population and disadvantaged groups in the country. It also emphasizes on the need to reinforce efforts in those poor performing districts that have already been identified as the high focus districts.

Maternal Health

Maternal health refers to a woman's health and well-being before, during, and after pregnancy and encompasses aspects of physical, mental, emotional, and social health. The World Health Organization defines maternal health as: "The health of women during Pregnancy, Childbirth, and the postnatal Period."

Maternal health also includes the absence of maternal morbidity, severe maternal morbidity, and maternal mortality.

Maternal Morbidity refers to health conditions that complicate pregnancy and childbirth or that have a negative impact on a woman's health and well-being.

Severe maternal morbidity (also called acute maternal morbidity) refers to outcomes of labor and birth that result in significant negative short- or long-term consequences to a woman's health.

Maternal Mortality Death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes.

Maternal health is an important aspect for the development of any country in terms of increasing equity and reducing poverty. The survival and wellbeing of mothers is not only important in their own right but are also central to solving large broader, economic, social and developmental challenges. Massive and strategic investments have been made under the National Health Mission for improvement of maternal health.

STATISTICAL MEASURES OF MATERNAL MORTALITY
Maternal mortality ratio (MMR): Number of maternal deaths during a given time period per 100000 live births during the same time period.
Maternal mortality rate (MMRate): Number of maternal deaths during a given time period divided by person-years lived by women of reproductive age (age 15–49 years) in a population during the same time period.
Adult lifetime risk of maternal death: The probability that a 15-year-old girl will eventually die from a maternal cause (4). The proportion of deaths among women of reproductive age that are due to maternal causes (proportion maternal; PM): The number of maternal deaths divided by the total deaths among women aged 15–49 years.

The women who die are in the prime of life responsible for the health and wellbeing of their families. Their death represents a drain on all development efforts. Above and beyond the social and economic rationale for preventing this burden of mortality and morbidity is moral imperative. Therefore, reducing the high maternal mortality in the developing world should be considered a key policy issue for health, social and economic development.

One of the key indicators of maternal mortality is the **Maternal Mortality Ratio (MMR)** which is defined as the number of maternal deaths during a given time period per 100,000 live births during the same time period. The target 3.1 of Sustainable Development Goals (SDG) set by United Nations aims at reducing the global maternal mortality ratio to less than 70 per 100,000 live births.

It is heartening that the Maternal Mortality Ratio of India has declined over the years from 130 in 2014-16 to 97 in 2018-20, as indicated in the graph below.

Figure 2.3: Showing Decline in Maternal Mortality in India.

Source- SRS

The Sustainable Development Goals and Maternal Mortality

The Sustainable Development Goals (SDGs) were launched on 25 September 2015 and came into force on 1 January 2016 for the 15-year period until 31 December 2030. Among the 17 SDGs, the direct health-related targets come under SDG 3: Ensure healthy lives and promote well-being for all at all ages.

With the adoption of the SDGs, the United Nations Member States extended the global commitments they had made in 2000 to the Millennium Development Goals (MDGs), which covered the period until 2015.

In the context of the Sustainable Development Goals (SDG), countries have united behind a new target to accelerate the decline of maternal mortality by 2030. SDG 3 includes an ambitious target: "reducing the global MMR to less than 70 per 100 000 births, with no country having a maternal mortality rate of more than twice the global average".

As per SRS (SPECIAL BULLETIN ON MATERNAL MORTALITY IN INDIA 2018-20, released on November 22), Seven states have already achieved the sustainable development goal target — Kerala (19), Maharashtra (33), Telangana (43), Andhra Pradesh (45), Tamil Nadu (54), Jharkhand (56), and Gujarat (57), according to the data. (Annexure-2.1)

Four key actions responsible for India's remarkable achievement are:

First, India has made a concerted push to increase access to quality maternal health services. Since 2005, coverage of essential maternal health services has doubled,

while the proportion of institutional deliveries in public facilities have tripled, from 70.6% in 2008-09 to 95.5% in 2021-22 as per the HMIS Key Indicator report for 2008-09 and 2019-20) (including private facilities, institutional deliveries).

Second, state-subsidized demand-side financing like the Janani Shishu Suraksha Karyakram – Pregnant women delivering in public health institutions under the Janani Shishu Suraksha Karyakram (JSSK) are entitled to absolutely free/no expense delivery, including caesarean sections. The initiative stipulates free diet drugs, diagnostics and blood, besides free transport from home to institution, or between facilities in case of a referral and drop back home. Similar entitlements have been put in place for ante-natal and post-natal complications during pregnancy and all sick infants accessing public health institutions for treatment. (Annexure-2.2 & 2.3)

The Janani Suraksha Yojana is a safe motherhood programme that provides cash assistance for delivery and post-delivery care under the National Health Mission that aims to reduce maternal and neo-natal mortality by promoting institutional delivery among the poor pregnant women.

Figure 2.4: Percentage of JSSK beneficiaries to Total number of pregnant women registered for ANC in 2020-2021 & 2021-2022.

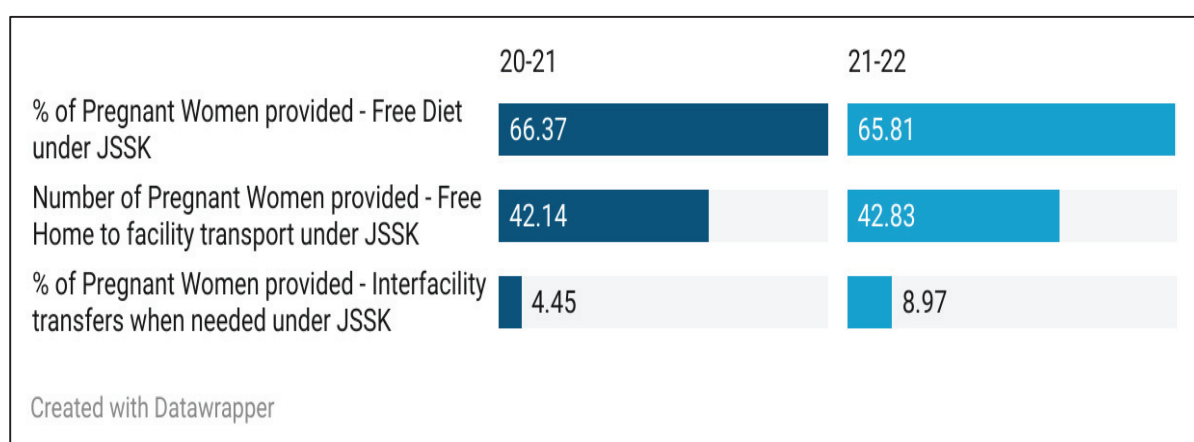

Figure 2.5: Percentage of JSSK beneficiaries to Total Number of public Institutional Deliveries conducted (Including C-Sections) 2020-2021 & 2021-2022.

Third, India has put significant emphasis on mitigating the social determinants of maternal health. Women in India are more literate than ever, with 71.5% (Source: NFHS-5) now able to read and write. There is a drop in the overall rate of child

marriages, from 26.8 per cent in the earlier National Family Health Survey (NFHS-4) to 23.3 per cent in NFHS 5. These factors alone have enabled Indian women to better control their reproductive lives and make decisions that reflect their own interests and wants.

Finally, the government has put in substantive efforts to facilitate positive engagement between public and private health care providers. Campaigns such as the Pradhan Mantri Surakshit Matritva Abhiyan have been introduced with great impact, allowing women's easy access to antenatal check-ups, obstetric gynecologists and to track high-risk pregnancies – exactly what is needed to make further gains and achieve the SDG targets.

Antenatal care (ANC):

Human rights law includes fundamental commitments of states to enable women and adolescent girls to survive pregnancy and childbirth as part of their enjoyment of sexual and reproductive health and rights and living a life of dignity. The World Health Organization (WHO) envisions a world where “every pregnant woman and newborn receives quality care throughout the pregnancy, childbirth and the postnatal period”

There is evidence that effective interventions exist at reasonable cost for the prevention or treatment of virtually all life-threatening maternal complications, and almost two thirds of the global maternal and neonatal disease burden could be alleviated through optimal adaptation and uptake of existing research findings. But a human rights-based approach is not just about avoiding death and morbidity – it is about enabling health and well-being while respecting dignity and rights.

Definition- Antenatal care (ANC) can be defined as the care provided by skilled health-care professionals to pregnant women and adolescent girls in order to ensure the best health conditions for both mother and baby during pregnancy.

The components of ANC include:

- Risk identification;
- Prevention and management of pregnancy-related or concurrent diseases; and
- health education and health promotion.

A proper antenatal check-up provides necessary care to the mother and helps identify any complications of pregnancy such as anaemia, pre-eclampsia and hypertension etc. in the mother and slow/inadequate growth of the foetus. Antenatal care allows for the timely management of complications through referral to an appropriate facility for further treatment. It also provides opportunity to prepare a birth plan and identify the facility for delivery and referral in case of complication.

Components of ANC:

Quality ANC has several components, which are described below:

Section A: Primary Steps:

- Early registration and first check-up is conducted within 12weeks (first three months of pregnancy).

- Track every pregnancy for conducting at least four antenatal check-ups (including the first visit for registration), keeping in mind all the essential components listed under.

Section B:

- Administer two doses of Td injection.
- Provide 180 tablets of IFA.

Section C: Essential components of every antenatal check-up:

- Patient's history taking.
- Physical examination—measure the weight, blood pressure and respiratory rate and check for pallor and oedema.
- Abdominal palpation for foetal growth, foetal lie and auscultation of Foetal Heart Sound (FHS) according to the stage of pregnancy.
- laboratory investigations, such as haemoglobin estimation and urine tests (for sugar and proteins).

Section D: Desirable components

- Blood group, including the Rh factor.
- The Venereal Disease Research Laboratory (VDRL)/Rapid Plasma Reagin (RPR) test to rule out syphilis.
- Test the woman for Human Immuno deficiency Virus (HIV*).
- Blood sugar.
- Hepatitis B Surface Antigen (HBsAg) test.

Section E: Counselling

- Help the woman to plan and prepare for birth (birth preparedness/micro birth plan). This should include deciding on the place of delivery and the presence of an attendant at the time of the delivery.
- Advantages of institutional deliveries and risks involved in home deliveries.
- Advise the woman on where to go if an emergency arises, and how to arrange for transportation, money and blood donors in case of an emergency.
- Educate the woman and her family members on signs of labour and danger signs of obstetric complications.
- Emphasise the importance of seeking ANC and PNC.
- Advise on diet (nutrition) and rest.
- Inform the woman about breastfeeding, including exclusive breastfeeding.
- Provide information on sex during pregnancy.
- Warn against domestic violence (explain the consequences of violence on a pregnant woman and her foetus).
- Promote family planning.
- Inform the woman about the Janani Suraksha Yojana (JSY)/any other incentives offered by the state.

ANC registration

ANC registration means registering an antenatal or pregnant woman in a hospital. This ensures that you are having regular check-up during your pregnancy.

Registration of a pregnant woman for ANC should take place as soon as the pregnancy is suspected. Every woman in the reproductive age group should be registered when pregnancy detect. Ideally, the first visit should take place within 12 weeks. However, even if a woman comes for registration later in her pregnancy, she should be registered and care should be provided to her according to the gestational age.

HMIS is capturing a series of data elements related to these aspects of Ante Natal care. To assess the extent of provision of services in any area, one of the benchmarks is to asses it against the Estimated/Expected beneficiaries. At National level, the total expected pregnant women for the year 2021-22 was 92.06%. (Annexure:2.4)

Figure 2.6: Coverage ANC Registration in India.

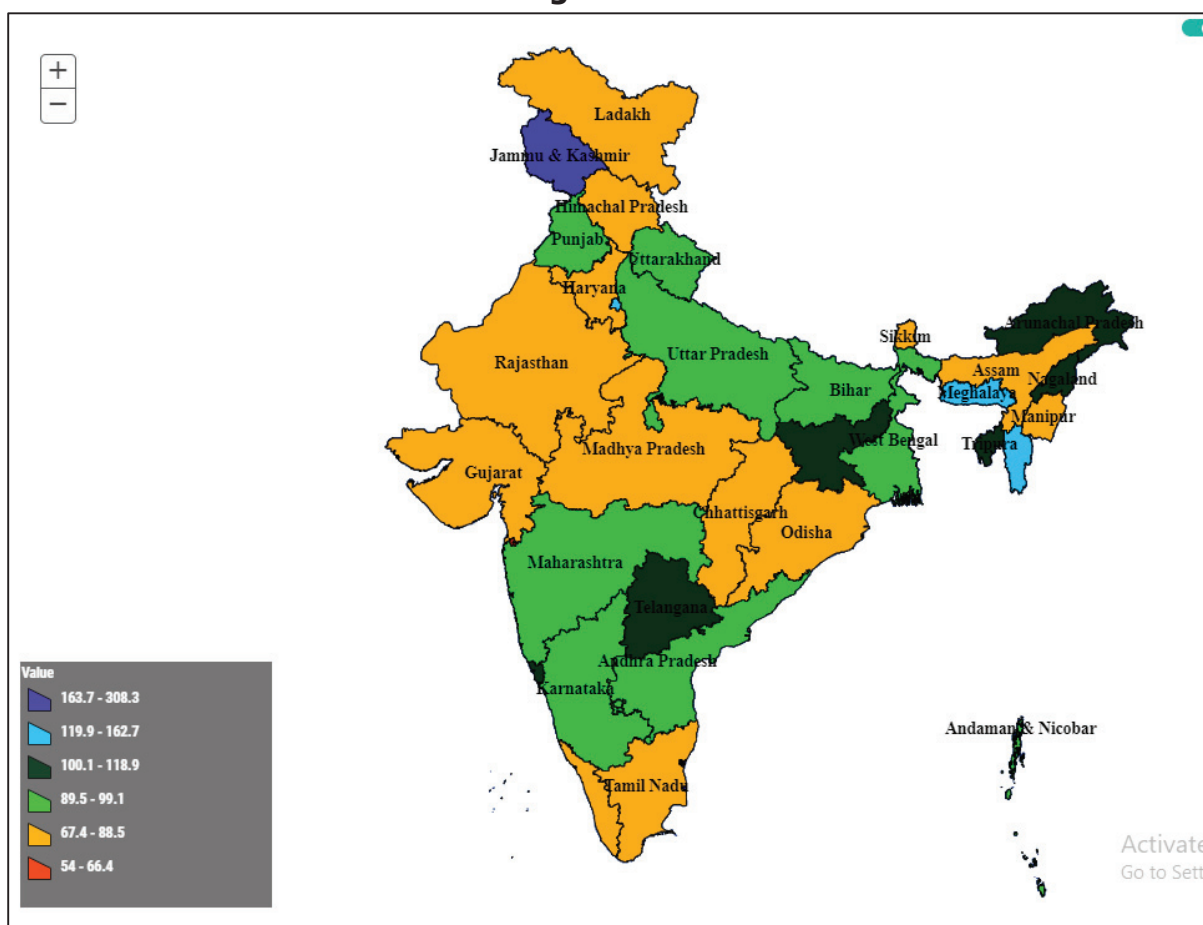

Figure 2.7: Percentage of ANC Registered against Estimated Pregnancies: 2020-2021

Source: HMIS Report 2020-2021

19 States have performed above the National Average of 92% for ANC Registration with Puducherry reporting the highest ANC registration over estimated pregnancies. Whereas 18 States have reported values less than the National Average of 92%.

Number and timing of visits: Ensure that every pregnant woman makes at least four visits for ANC, including the first visit/registration. It should be emphasised that

Suggested schedule for antenatal visits:

- Within 12 weeks—preferably as soon as pregnancy is suspected—for registration of pregnancy and first antenatal check-up
- 2nd visit: Between 14 and 26 weeks
- 3rd visit: Between 28 and 34 weeks
- 4th visit: Between 36 weeks and term

this is only a minimum requirement and that more visits may be necessary, depending on the woman's condition and needs.

Early initiation of Antenatal care (ANC)

The first visit or registration of a pregnant woman for ANC should take place as soon as the pregnancy is suspected. Ideally, the first visit should take place in the first trimester, before or at the 12th week of pregnancy

- Early registration of ANC within first 12 weeks of pregnancy aids early documentation of the woman's baseline physiological and laboratory parameters for subsequent comparison, early detection of anomalies with the progress of pregnancy, avoiding teratogens, provides opportunities for preventive health care's services such as immunization against neonatal tetanus, prophylaxis and treatment of diseases, diagnosis and treatment of medical disorders. This also helps in providing the woman the option of an early abortion. It is important to find out as early as possible whether the woman wants to go in for an abortion so that the procedure can be done safely as per the legal provisions laid down under the Medical Termination of Pregnancy (MTP) Act, 1972.

Early detection of pregnancy is important for the following reasons:

- It facilitates proper planning and allows for adequate care to be provided during pregnancy for both the mother and the foetus.
- Record the date of the Last Menstrual Period (LMP), and calculate the Expected Date of Delivery (EDD).
- The health status of the mother can be assessed and any medical illness that she might be suffering from can be detected and also to obtain/record baseline information (on blood pressure, weight, haemoglobin, etc.) Helps in timely

detection of complications at an early stage and manages them appropriately by referral as and where required.

Figure 2.8: Percentage of Early registration (within 12 weeks) of pregnancy to total Registration of ANC:

Source: HMIS Report

Increasing trend of early registration is observed as per the HMIS report. It is observed that in 2020-21 early registration percentage is only 73.9 whereas 75.7percentage in 21-22. This tells the success of the program at the ground level.

Figure 2.9: Showing Comparison of Pregnant Women who had Antenatal Checkup in first trimester.

Comparison of Pregnant woman who had antenatal checkup in the first trimester from 2020-2021 to 2021-2022

Created with Datawrapper

PW received 4 or more ANC check-ups:

The proportion of pregnant women receiving 4 or more antenatal care visits (ANC 4+) is used prominently as a global benchmark indicator to track maternal health program performance.

Conventional ANC comprised about 12 visits (one visit each month during the first 6 months of pregnancy, once every 2–3 weeks for the next 2 months, and ANC 4+ has been the most frequently used summary measure of maternal health program performance.

Receiving antenatal care at least four times increases the likelihood of receiving effective maternal health interventions during the antenatal period. This is one of the indicators in the Global Strategy for Women’s, Children’s and Adolescents’ Health (2016-2030) Monitoring Framework, and one of the tracer indicators of health services for the universal health coverage (SDG indicator 3.8.1). HMIS is capturing ANC 4 + data since 2017-18.

Figure 2.10: Showing Ascending Trends of ANC Checkups 4 or more times during the Pregnancy.

As per HMIS approximately 63.5% of women receive four or more ANC in 2017-18 , in 2018-19 it is increased upto 73.3%, showing annual growth of 15 % and 9.3% of annual growth in 2019-20 however the HMIS data showing annual decrees (6.3%) of 4 or more ANC in 2020-21.

The percentage of states of Nagaland, Arunachal Pradesh, and Manipur with four or more antenatal check-ups is less than 50% in 2020-2021 and 2021-2022. The performance of twenty-one states are worse than the national average. (Annexure:2.5)

Figure 2.11: State wise trend of 4 ANC or more in India

Quality of antenatal care

HMIS also captures the quality indicators of the antenatal care. Good quality of ANC helps in reducing the risk of stillbirths and pregnancy complications and give women a positive pregnancy experience. These quality indicators ensure not only a healthy pregnancy for the woman and the baby, but also an effective transition to positive childbirth and ultimately to a positive experience of motherhood.

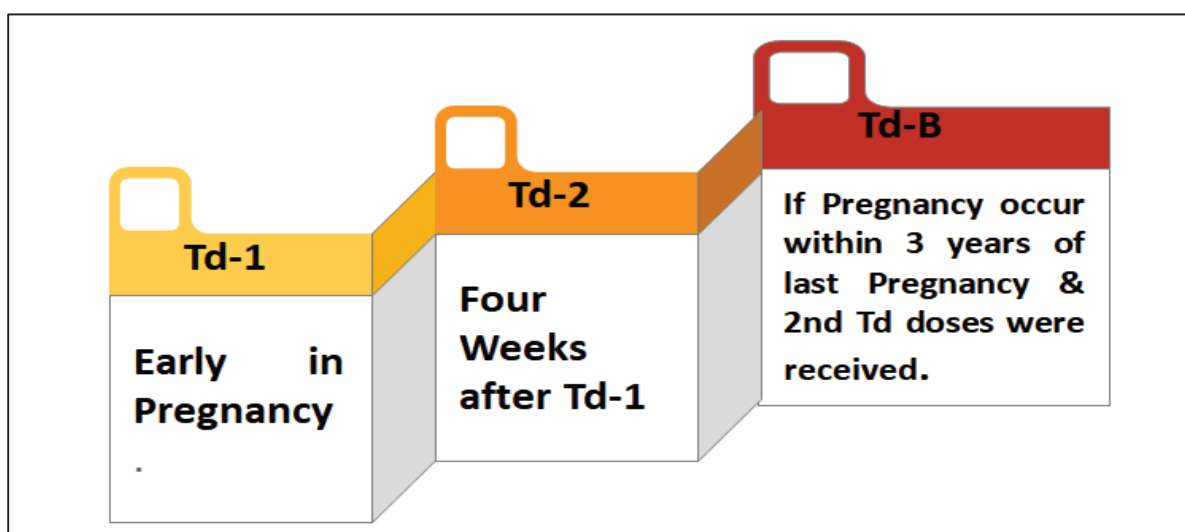

Tetanus toxoid vaccination:

Tetanus is a disease that can be prevented by vaccines containing tetanus-toxoids. Antibodies produced by maternal immunization that pass to the fetus via the placenta protect the baby in terms of tetanus during the neonatal period. Elimination of maternal New-born Tetanus (MNT) has been defined as less than 1 NT case per 1000 live births in a specific region by the World Health Organization (WHO). MNT elimination strategies include vaccination, hygienic practices at delivery, and surveillance. India was declared free of maternal and neonatal tetanus on 15th May, 2015. Unlike polio or small pox, tetanus can't be fully eradicated as the tenacious spores of bacteria causing tetanus, clostridium tetani, are widespread in the environment. The journey towards its elimination from India has not been easy, and sustained efforts will be required to maintain this status.

HIMS captures the three indicators related to prevention of tetanus through tetanus vaccine coverage viz,:

1. Number of PW given TT1/Td1
2. Number of PW given TT2/ Td2
3. Number of PW given TT booster./TT booster.

Figure 2.12 UIP schedule of Td vaccine during Pregnancy

Source: Tetanus and adult diphtheria (Td) Operational Guidelines, MOHFW

The annual TT coverage rate in Pregnant women as per HMIS at all India level is only 86.5% out of which 76 % coverage is from Urban and 89% from rural sector.

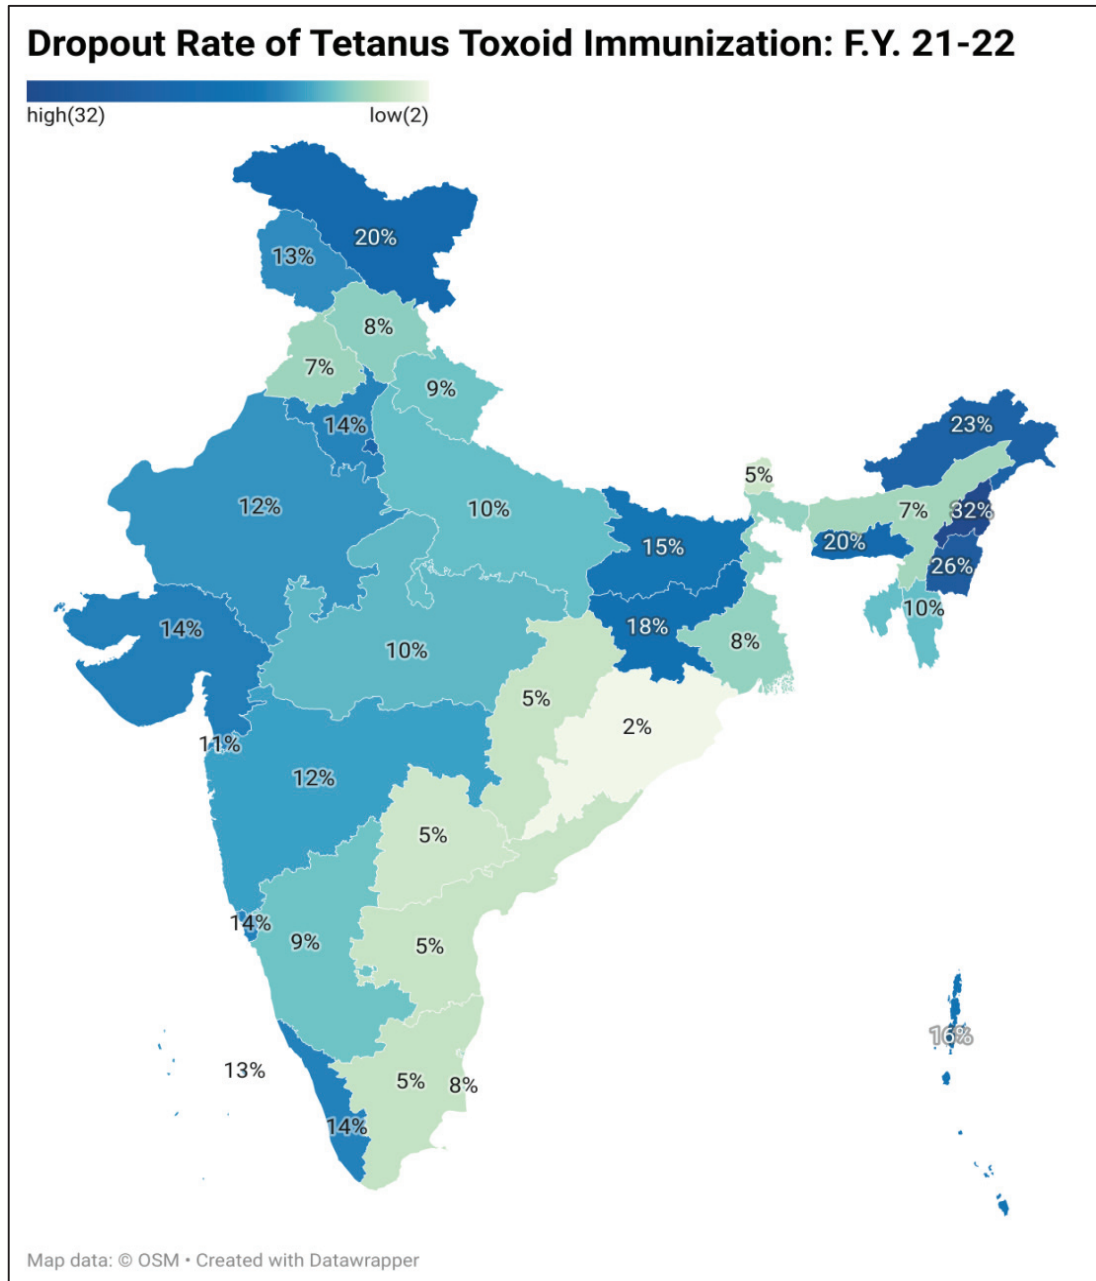

The lowest TT coverage rate in pregnant women is found in Puducherry 25.9%, Nagaland 44.4% and Goa 46.19%. (Annexure-2.6 & 2.7)in2021-2022.

Figure 2.13: Showing TT coverage in India

The dropout rate of TT1 from TT 2 in pregnant women at national level is 11.9% in FY 2021-2022 out of which 16% are from urban and 9 % from rural. Highest dropouts from TT1 to TT2 coverage is found in Nagaland (32%), followed by Manipur (26%), Delhi (22%).

Figure:2.14 Showing Dropouts of TT/Td vaccination during Pregnancy.

It is also observed that the coverage of TT in pregnant women of India is better in the rural India as compared to the urban India.

Maternal Anemia-

Anemia has been recognized as the most common form of nutritional deficiency worldwide. The overall iron requirement during pregnancy is significantly greater than in the non-pregnant. Though anaemia is easily treatable and preventable disease, it continues to be significantly associated with pregnancy. The physiological iron demand in pregnant women corresponds roughly to 1000–1200 mg for an average weight of 55 kg.

Hemoglobin value <11 g/dL is defined as anemia in pregnancy by WHO.

Anemia in pregnancy can be further divided as:

- Mild anemia : hemoglobin level 10.0–10.9 g/dL
- Moderate anemia 7–9.9 g/dL
- severe anemia <7 g/dL.

Who guideline for Hb estimation during pregnancy.

- Compulsory Hb estimation: by Cyanmeth-haemoglobin method by using Semi-autoanalyser or photo calorimeter.
- At 14-16 weeks, 20-24 weeks, 26-30 weeks and 30-34 weeks of pregnancy in all pregnant women.
- Minimum of 4 Hb estimation; minimum 4 weeks apart.

Figure 2.15: Percentage of Pregnant Woman tested for Hb 4 or more times for respective ANC.

Prevalence of Anaemia in Pregnancy:

At the national Level the prevalence of anaemia in F.Y.20-21 is 67.9% & 70% in 2021-22. In 2021-2022, highest prevalence of anemia found in State of Haryana (97.5%), Himachal Pradesh(90%),Maharashtra (85%), Mizoram(82%), Punjab & (81%). Though Kerala, Puducherry and some north-eastern states have recorded a low prevalence across categories, these states have also witnessed an increase in prevalence since F.Y. 19-20.

Figure 2.16: Prevalence of Anaemia in Pregnancy.

HMIS captures the two data elements describing the severity of anaemia:

1. Number of PW having Hb level<11 (out of total tested cases)(7.1 to 10.9)
2. Number of PW having Hb level<7 (out of total tested cases)

At national level in 2021-22, the Pregnant women falls in the category of mild anemia (10.9 to 7.1 gm% of Hb) are 95.5% and only 4.5% of the pregnant women have Hb less than 7 gm%.

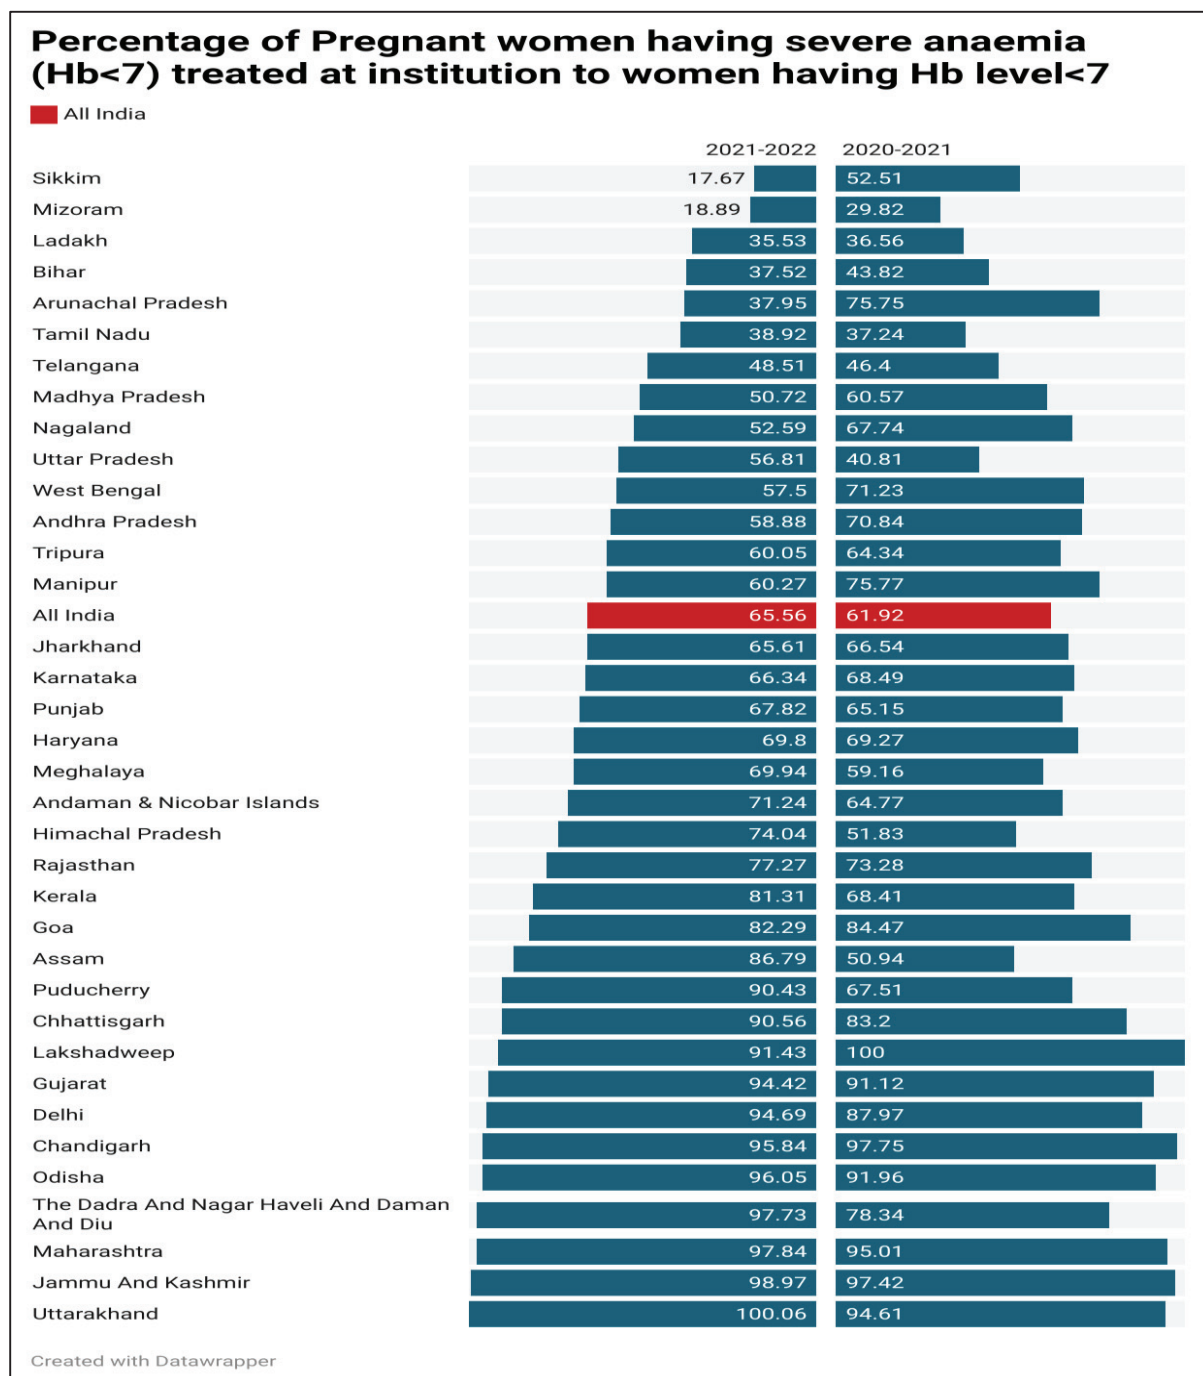

Figure 2.17 Anemia prevalence by severity.

Management of Anaemia at Institution:

It is observed that at all India level only 65.56% of Pregnant women having severe anaemia (Hb<7) treated at institution to women having Hb level<7 in 2021-2022 and 62% in 2020-2021. The lowest anemia (Hb level<7) treatment rate found in Sikkim (17.6%), Mizoram (18.8%), Ladakh(35.5%) and Highest coverage of treatment found in Uttarakhand(100%), Jammu and Kashmir(98.9%), Maharashtra(97.8%).

Figure 2.18: Showing State wise coverage of treatment of Pregnant woman having anemia (Hb<7).

Anemia Mukht Bharat

To achieve the targets of World Health Assembly of 50% reduction of anemia in women of reproductive age by 2025 and POSHAN Abhiyan (2018-2022) to reduce the prevalence amongst young children (6-59 months), adolescents and women of reproductive age groups (15-49 years) by three percent per year, Anemia Mukht Bharat has been designed. The operational guidelines were launched by Honorable Prime Minister Shri. Narendra Modi on 14th April, 2018 in Bijepur, Chhatisgarh. The beneficiaries are children 6-59 months, children 5-9 years, adolescent boys 10-19 years, adolescent girls 10-19 years, women of reproductive age (20-49 years), pregnant women and lactating women (0-6 months).

Key interventions for Pregnant women in Anemia Mukat Bharat are:

A Key intervention is to give IFA to pregnant women irrespective of anemia under Anemia Mukat Bharat.

Group	Dose & regime
Pregnant Women and Lactating Mothers (of 0-6 months child)	Daily, 1 Iron and Folic Acid tablet starting from the fourth month of pregnancy (that is from the second trimester), continued throughout pregnancy (minimum 180 days during pregnancy) and to be continued for 180 days, post-partum Each tablet containing 60 mg elemental Iron + 500 mcg Folic Acid, sugar-coated and red-colour.

Coverage of Iron Folic acid supplementation:

HMIS captures the indicator for tracking of coverage of iron folic acid supplementation: Number of PW provided full Course 180 Iron Folic Acid (IFA) tablets. At national level the coverage of Pregnant women provided full course 180 Iron folic acid is 92% in 2021-22 and 90% in 2020-21. The highest coverage found in the State of Chhattisgarh (99.9%), Maharashtra (98.2%), Assam (96.9%) whereas lowest coverage found in Manipur (32%), Nagaland (42%), Meghalaya (59.8%).

Figure 2.19: Showing coverage of prophylactic 180 Iron Folic Acid distributions to pregnant woman.

Deworming during Pregnancy:

WHO recommends periodic treatment with anthelmintic (deworming) medicines, without previous individual diagnosis to all at-risk people living in endemic areas. It defines at-risk people as pre-school-aged children, school-aged children, and women of childbearing age (including pregnant women in their second and third trimesters and lactating women). Considering the potential benefits and high infestation load from the public health perspective, deworming is recommended routinely during pregnancy.

Prophylactic dose and regime for deworming in India.

Group	Dose & Regime
Pregnant Women and Lactating Mothers (0-6 months)	One dose of 400 mg Albendazole (1 tablet), after the first trimester, preferably during the second trimester.

Appropriate administration of antihelminthics results in curing the infestation or lessening the intensity of worm burden, which benefits both pregnant woman and communities by potentially improving the overall health and wellbeing of these women and by reducing the number of eggs shed in the environment.

As per HMIS report of FY 21-22 only 55.36 % of pregnant women given one tablet of albendazole after first trimester. Highest coverage found in the State of Gujarat (86.74%) followed by Chhattisgarh(83.22%) The lowest in Kerala (4.89%), . (Annexure:2.8)

Figure 2.20: Percentage of PW given one Albendazole tablet after 1st trimester: All India

Hypertension is the most common medical problem encountered during pregnancy, complicating 2-3% of pregnancies as per HMIS.

Hypertensive pregnancy disorders cover a spectrum of conditions, including preeclampsia/eclampsia, gestational hypertension, chronic hypertension, and preeclampsia superimposed on chronic hypertension. Hypertensive pregnancy disorders complicate 10% of pregnancies and cause significant maternal and fetal morbidity and mortality.

Classification of Hypertension in Pregnancy

Hypertension—systolic blood pressure of 140 mmHg or more and/or diastolic blood pressure of 90 mmHg or more, on two consecutive readings taken four hours or more apart.

Pre-eclampsia—hypertension developing after 20 weeks gestation with proteinuria and/or edema.

Eclampsia—hypertension developing after 20 weeks gestation with proteinuria and convulsions.

As per HMIS the national prevalence of Pregnancy induced hypertension in 20-2021 is 2.17 % and 2021-2022 is 2.22%. However, Pregnancy induced hypertension cases managed at institution in 2020-2021 is 69.6 and 71.5 in 2021-22.

Table 2.2: Showing Prevalence of Hypertension and its Management during Pregnancy

Indicators	20-21	21-22
Percentage of New cases of PW with hypertension detected to total number of pregnant women registered for ANC	2.17 %	2.22 %
Percentage of PW with hypertension detected, cases managed at institution to New case of PW with hypertension detected.	69.6 %	71.5 %
Number of Eclampsia cases managed during delivery to Institutional Deliveries conducted (Including C-Sections)	0.32%	0.34%

Source: HMIS

It is also observed that in HMIS the highest percentage of pregnancy induced hypertension cases was detected in Tamil Nadu 6.3% in 2021-2022, however, in 20-21 it is 5.5% in 2020-2021.

Gestational Diabetes Mellitus (GDM)

Gestational Diabetes Mellitus (GDM) is defined as Impaired Glucose Tolerance (IGT) with onset or first recognition during pregnancy. Undiagnosed or inadequately treated GDM can lead to significant maternal & fetal complications. Moreover, women with GDM and their offspring's are at increased risk of developing type 2 diabetes later in life.

Consequences of GDM:

Maternal risks of GDM include polyhydramnios, pre-eclampsia, prolonged labour, obstructed labour, cesarean section, uterine atony, postpartum hemorrhage, infection and progression of retinopathy which are the leading global causes of maternal morbidity and mortality.

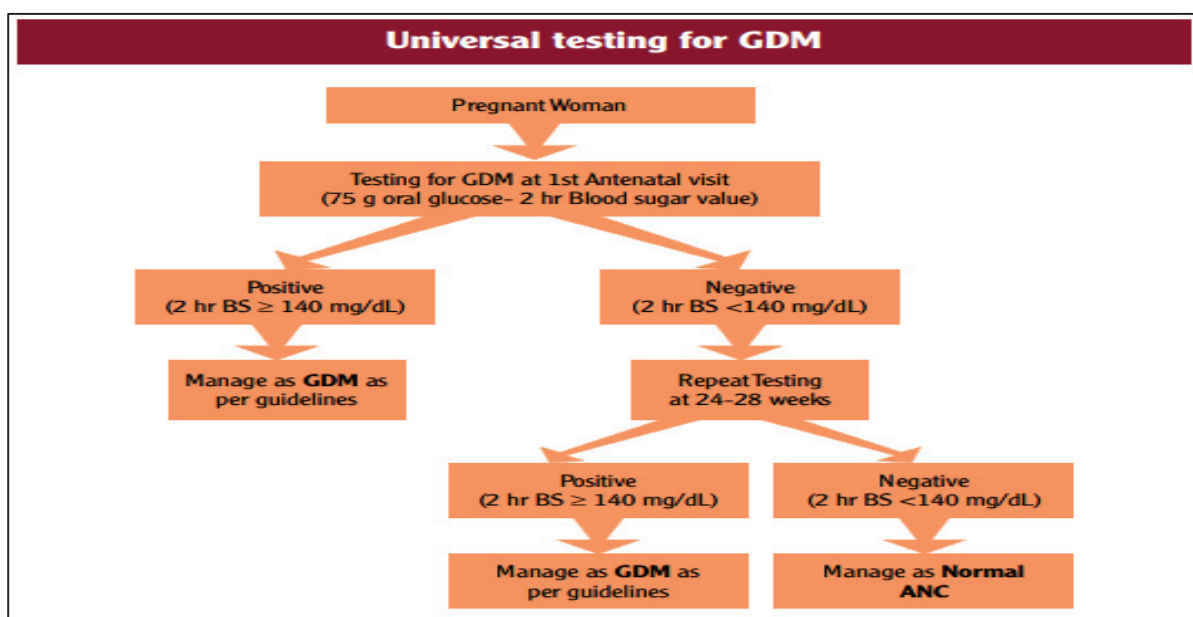

Fetal risks include spontaneous abortion, intra-uterine death, stillbirth, congenital malformation, shoulder dystocia, birth injuries, neonatal hypoglycemia and infant

respiratory distress syndrome. Long term clinical effects of GDM are important contributors to the burden of non-communicable diseases in many countries.

National Guidelines on Diagnosis and Management of Gestational Diabetes Mellitus

Government of India released a "National Guidelines on Diagnosis and Management of Gestational Diabetes Mellitus" in 2014 to address the need of high prevalence of GDM in India. The initiatives led to integration of GDM diagnosis and management within ANC care package in public health system.

Guidelines advocate for universal screening of all pregnant women at first antenatal contact. If the first test is negative, second test should be done at 24-28 weeks of gestation.

HMIS captures the Number of Pregnant woman tested for blood sugar using OGTT (Oral Glucose Tolerance Test).

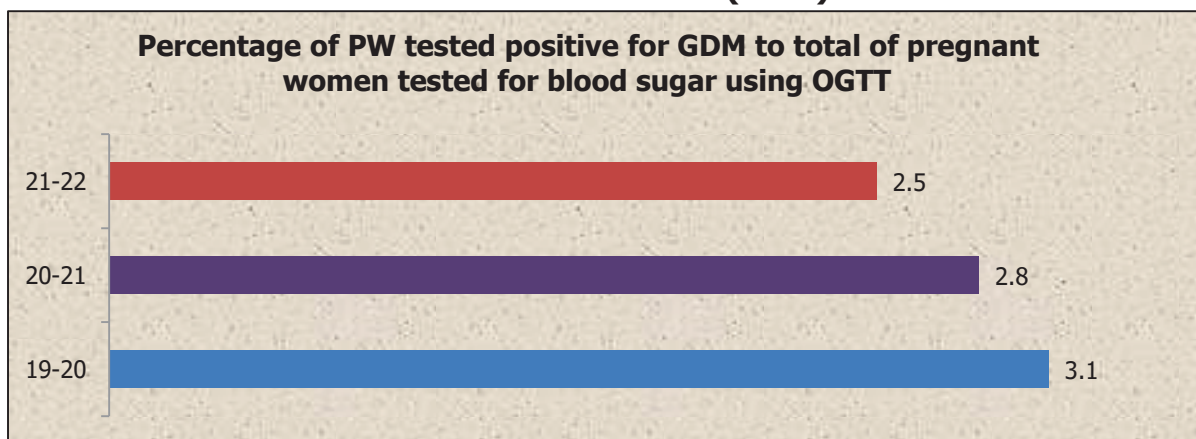

Figure 2.21 Showing Percentage of mother undergone OGTT test for detection of gestational diabetes during ANC.

The above figure shows that as per HMIS report in 2019-20 only 16% of women tested for OGTT to the total ANC and in 20-21 it is 15.5% and in 20.5% for 21-22.

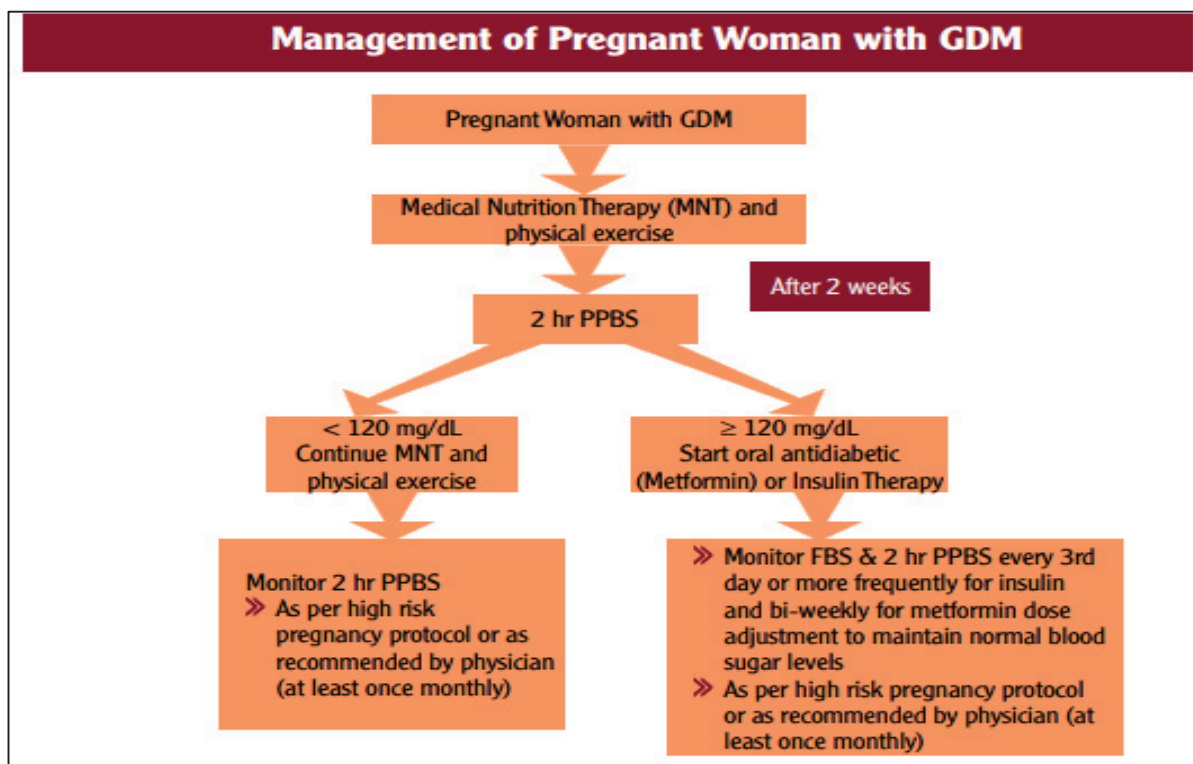

In India 21-22 as per HMIS report percentage of pregnant women tested for blood sugar using OGTT to Total ANC Registration is 20.48 and 15.5% in 2020-2021.

Figure 2.22 Showing trends of Gestational Diabetes Mellitus (GDM) in India.

Management of GDM:

GDM is managed initially with MNT and physical exercise and if it is not controlled with MNT (lifestyle changes), Metformin or Insulin therapy is added to the MNT should be started on Medical Nutrition Therapy (MNT)

HMIS captures the GDM management indicator Number of PW given insulin out of total tested positive for GDM. Insulin therapy is the accepted medical management of pregnant women with GDM not controlled on MNT. Insulin is the first drug of choice and metformin can be considered after 20 weeks of gestation for medical management

of GDM. Insulin can be started any time during pregnancy for GDM management. If pregnant women with GDM before 20 weeks, and Medical Nutrition Therapy (MNT) failed, Insulin should be started.

Figure-2.23: Showing Percentage of Pregnant mothers received human insulin as a management of Gestational Diabetes Mellitus (GDM) in India

Childbirth:

Bringing a baby into this world is a long and arduous process. Pregnant women have a gestation period of over nine months, during which ample prenatal care is required. The baby (or babies, if carrying multiple foetuses) is delivered at the end of this gestation period, although many babies are born prematurely too.

Place of Delivery

Home Delivery: A home birth is a birth that takes place in a residence rather than in a hospital or a birthing centre.

Maternal delivery at home without skilled care at birth is a major public health issue. Maternal death is a severe public health problem where home delivery without skilled care at birth has a significant detrimental impact. Most importantly, as women are dying from preventable causes during childbirth, non-institutional or home delivery needs to be eliminated. Sustainable Development Goal 3 (SDG-3) targets: "reducing the global MMR to less than 70 per 100,000 births, with no country having a maternal mortality rate of more than twice the global average. In India 1067470 home delivery reported HMIS in 2020-21 and 922637 in 2021-22. Highest numbers of home deliveries 40.6% and 42.8 % are found the State of Meghalaya in 20-21 and 21-22 respectively. The state of Nagaland, Manipur, Bihar, Utrakhand, Mizoram, Assam, Uttar Pradesh, Himachal Pradesh, Tripura, Jammu & Kashmir and Delhi are the states where home deliveries are found more than national average. (Annexure:2.9)

Table 2.3 Showing Place of deliveries in India in Percentage

Home delivery and Institutional Delivery in India				
States	20-21	20-21	21-22	21-22
	% Home Delivery	% Institutional Deliveries	% Home Delivery	% Institutional Deliveries

Birth Attendant for Home deliveries :

As per HMIS in 2021-2022, 4.5 % of births in India take place at home and a large proportion are assisted by unskilled persons. It is estimated that nearly 15 present mothers will develop one or other life threatening obstetric complications during intra partum and immediate post-partum period Since any pregnancy can develop complications at any stage which cannot be predicted. Keeping this in view, it is essential that all mothers have access to a birth attendant, who has requisite midwifery skills to recognize complications, manage as per scope of practise and refer if needed. Government of India is committed to ensure universal coverage of all births with skilled attendance both in the institution and at community level and to provide access to emergency obstetric care services for women experiencing serious complications. To be called an SBA, the health workers (Auxiliary Nurse Midwives (ANMs), Lady Health Visitors (LHVs) and Staff Nurses (SNs)) must possess technical competence related to routine care provision including identification and immediate management of complications arising during pregnancy and childbirth.

Figure 2.24: Showing Percentage of Home Deliveries attended by Skill Birth Attendant.

Source: HMIS report.

GoI considers an SBA to be a person who can handle common obstetric and neonatal emergencies and is able to timely detect and recognise when a situation reaches a point beyond his/her capability, and refers the woman/new-borns to an appropriate facility without delay. Out of total home deliveries only 18.5 % of home deliveries were attended by Skilled Birth Attendant in 2020-2021 and 20.5% in 2021-2022. (Annexure :2.10)

C-Section deliveries in India:

The caesarean section is a globally recognised maternal health-care indicator. Cesarean section (CS) when indicated is a life saving procedure but when performed without appropriate indications can add risk to both mother and baby. Unnecessary caesarean sections also pull resources away from other services in overloaded health system.

Figure-2.25: Showing increasing trends of C- section deliveries in India as per NFHS report.

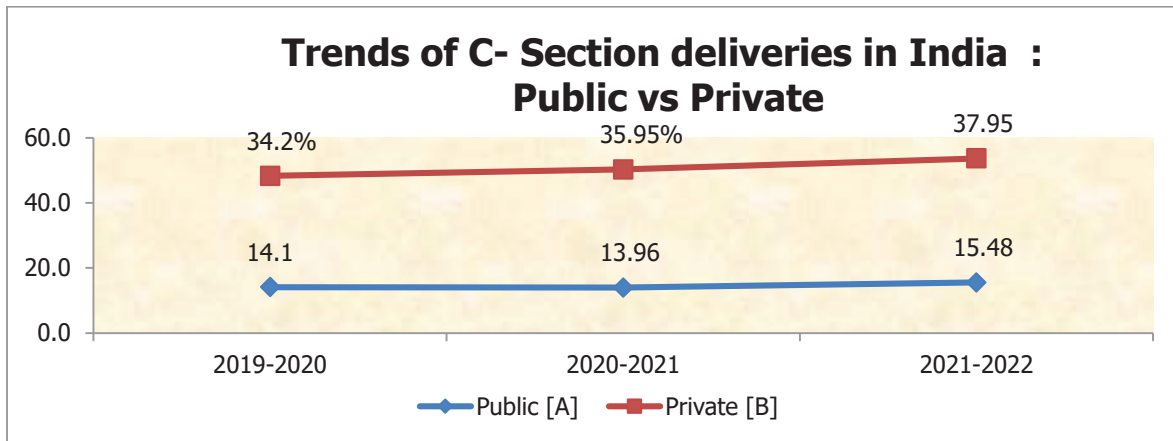

The World Health Organization (WHO) recommends that the percentage of caesarean deliveries should not exceed 10% to 15% in any nation. In India as per HMIS total 20.5 % of c section deliveries reported in 2019-2020. In 2020-21 it increases to 21.3% and 23.29% in 2021-22. The trends show that highest percentage of C section deliveries were reported from Telangana 55.33% in 2020-2021 and 54.09% in 2021-2022.(Annexure:2.11)

Figure 2.26 Showing increasing trends of C- section deliveries in India as per HMIS report.

It is also observed that higher percentage of C section deliveries were found in private facilities the figure below is showing a trend of very higher percentage of C section deliveries in Private hospitals as compare to c section deliveries in public facilities.

Figure 2.27 Showing C –section deliveries trends in Public and Private Institutions in India.

C section deliveries in Private Institutions in HMIS

Highest percentage of c section deliveries in private institutions who were reported in HMIS found in Andaman and Nicobar Islands followed by Tripura in 2020-2021 and in 2021-2022

The lowest percentage of C-section deliveries in private hospitals reported in HMIS were found in Rajasthan 18.9 % followed by Jharkhand 20.2% in 2020-2021. In 2021-2022 the lowest number of institutional deliveries in private institutions who are reported in HMIS were found in Jharkhand(20.09%),Uttar Pradesh (20.11) followed by Uttrakhand (20.34). (Annexure:2.11)

Comprehensive abortion care:

Abortion is the termination of a pregnancy. It is defined as 'the intentional ending of a pregnancy', by the Cambridge Dictionary.

Unsafe abortion is a preventable – cause of maternal deaths and morbidities. It can lead to physical and mental health complications and social and financial burdens for women, communities and health systems. (WHO, Key facts November 21)

India was among the first countries to legalize abortion. Abortion has been legal in India since 1971 under broad criteria, including economic or social necessity, rape, incest, fetal impairment or contraceptive failure within marriage.

Comprehensive abortion care is included in the list of essential health care services published by WHO in 2020. Abortion is a simple health care intervention that can be effectively managed by a wide range of health workers using medication or a surgical procedure.

Comprehensive abortion care includes the provision of information, abortion management and post-abortion care. It encompasses care related to miscarriage (spontaneous abortion and missed abortion), induced abortion (the deliberate interruption of an on-going pregnancy by medical or surgical means), incomplete abortion as well as fetal death (intrauterine fetal demise).

Induced abortion provision is permitted at all government-run facilities at the Public Health Centre and higher levels, as long as the provider is registered in abortion provision. However, several factors contribute to the inadequacy of access to public sector abortion services, including high proportions of public facilities lacking trained staff and necessary equipment and supplies.

Based on the data reported on HMIS portal during 2020-21 and 2021-22, the abortion rate (Number of abortions to total ANC at all India level is 3.9% and 4.1% respectively. In 2021-2022 the highest percentage of abortions found in Andaman & Nicobar island (22.9%) followed by Assam 12.7% whereas lowest abortions rate found in Bihar (0.4%) followed by Telangana (0.9%).

Graph 2.28: Showing State/UT-wise Percentage of abortion to total ANC reporting above the National Average:

In 2021-2022, it is also observed that the out of total abortions 48.10 % of abortions are spontaneous. It is also observed that highest percentage spontaneous abortions found in the State of Meghalaya (95%), followed by Lakshadweep (93%), Ladakh (86.7%), Mizoram (83.3%). The lowest Percentage of spontaneous abortions are reported by Arunachal Pradesh (8.8%) followed by Andaman & Nicobar Islands (16.8%), Nagaland (21.6%), Assam (24.0%).

Figure 2.29: Showing Percentage of Spontaneous abortion and Induced abortions at National Level.

MTP more than 12 weeks of Pregnancy

The earlier an abortion is provided the safer it is, because earlier abortions are less complicated. Therefore, it is important that women who decide to get abortions can do so without unnecessary delays. In fact, 90.48% of all abortions in India are obtained within the first 12-13 weeks after the last menstrual period (LMP) (HMIS report 2021-22). Sometimes, however, women have compelling reasons to obtain abortions in later weeks.

While abortions at or after 13 weeks gestation comprise a minority (around 9.5% in 2021-22) of the total abortions at Nationwide as per HMIS reporting, they are responsible for the majority of serious abortion-related complications.

Table 2.4 Showing: Terminating a pregnancy at different gestational periods as per MTP Act

Time since conception	Requirement for terminating pregnancy	
	MTP Act,1971	MTP (Amendment) Bill,2020
Up to 12 weeks	Advice of one doctor	Advice of one doctor
12 to 20 weeks	Advice of two doctors	Advice of one doctor
20 to 24 weeks	Not allowed	Two doctors for some categories of pregnant women
More than 24 weeks	Not allowed	Medical Board in case of substantial foetal abnormality
Any time during the pregnancy	One doctor, if immediately necessary to save pregnant woman's life	
Note: *Doctor refers to registered medical practitioner with experience/training in gynaecology or obstetrics.		

Source- The Medical Termination Of Pregnancy (Amendment) Act, 2021. (<https://egazette.nic.in/WriteReadData/2021/226130.pdf>)

Figure 2.30: State/UT wise Percentage of MTP more than 12 weeks of pregnancy.

Source:HMIS report

Post Abortion/ MTP Complications:

MTP and spontaneous miscarriages, can lead to a variety of complications. Most complications are considered minor such as pain, bleeding, infection, and post-anesthesia complications. Others are major, including uterine atony and subsequent hemorrhage, uterine perforation, injuries to adjacent organs (bladder or bowels),cervical laceration, failed abortion, septic abortion, and disseminated intravascular coagulation (DIC)(WHO fact sheet <https://www.who.int/news-room/fact-sheets/detail/abortion>).

There are three major mechanisms by which abortion complications can be classified.

1. Infection can be the result of a failure to exercise universal precautions prior to the procedure, such as hand washing, surgical glove use, proper sterilization of the field, use of non-sterile instruments, as well as the presence of a pre-existing infectious process in a patient such as cervicitis or endometritis.
2. Incomplete evacuation of the products of conception leads to the collection of blood in the uterus, causing over distention and atony which results in hemorrhage. It can also lead to infection and possible sepsis.
3. Injury from the surgical procedure itself depends upon the method used and includes vaginal or cervical lacerations, as well as uterine, bowel, or bladder injury.

Figure 2.31: Showing All India percentage of Post Abortion/MTP Complications identified

Uttar Pradesh (9.0%) reported highest post abortion complications followed by Madhya Pradesh (7.7%) in 2021-22.

Postnatal Care: (PNC)

As per the World Health Organization, postpartum period or postnatal period is defined as the period immediately following birth of the baby and extending for about 6 weeks. This period represents a critical phase in determining the health and survival of the mother and her newborn. Most of the maternal and infant deaths occur in the 1st month after birth: "Almost half of postnatal maternal deaths occur within the first 24 hour. According to the WHO (2015), the first 24 h postpartum is the highest risk period for women and newborns. For both the mother and the infant, immediate postnatal care is important to treat complications, like postpartum infections, excessive bleeding, pain in the perineal area, vaginal discharge, etc., that arise from birth and to provide the mother with relevant information on caring for herself and her baby. The extent to which women receive such care is directly related to the length of their postpartum

stay. Postpartum length of stay after delivery has been identified as an essential quality indicator of woman care. Ensuring 48 hrs. stay in hospital during childbirth and through subsequent home visits on 3rd, 7th ,14,21,28, and 42nd days is the important components for identification and management of emergencies occurring during postnatal period.

As per maternal and child health program guidelines in India, it is clearly mentioned that all the government health facilities should discharge the mother and baby only after 48 hours of delivery in case of normal delivery and after 7 days in case of delivery conducted by cesarean sections.

Figure 2.32: Showing Hours of Stay in Hospital after the delivery in Percentage

Source: HMIS Report

Length of stay after childbirth is also an important factor influencing MMR, but it has not increased to the same degree as institutional birth. There was a gigantic increase in institutional births from 39% in 2005–06 to 95.45% in 2021-2022 and 95% in 2020-2021. During the same period, the percentage of mothers discharged within 48 hrs. is only 32% in 2021-2022 and 33.6% in 2020-21.

Figure 2.33: Showing top five states where woman stay in hospital less than 48 hours after the delivery FY: 2021-2022.

Although it is not desirable and all efforts should be made to convince the mothers to stay in the institution for the first 48 hrs. The above graph is showing top five States where mothers return home before 48 hrs. of delivery reported in HMIS.

However this percentage is very low in Goa (0.04%) followed by Tamil Nadu (0.2%), Puducherry (1.1%), Tripura (5.6%) and Karnataka (7.4%), in FY 2021-2022.

Iron & Calcium Supplementation in Post-Partum woman:

Dietary requirement for different nutrients increases during pregnancy and lactation. The dietary intake of many Indian women, however, is significantly below recommended dietary requirements. Of these, two most important nutrients are iron and calcium.

Iron Supplementation:

Post-partum period may serve as a time to restore iron lost during pregnancy and delivery, however this period may serve as a time to restore iron lost during pregnancy and delivery. One of the strongest predictors of postpartum anaemia is anaemia during pregnancy, as iron stores tend to remain low for several months after childbirth, especially if there is significant blood loss during the delivery and additional iron is not consumed in sufficient quantities. Iron deficiency and anaemia during the postpartum period may have long-term health implications for the mother and her infant. Mothers with low iron stores at the time of delivery and following childbirth may experience fatigue, altered cognition and depressive symptoms. These alterations in the mother's emotional and cognitive functioning may, in turn, affect her interactions with the infant and may negatively impact infant behaviour and development (WHO Guideline: Iron supplementation in postpartum women).

Iron supplementation has proven to be effective for increasing haemoglobin concentrations among pregnant and non-pregnant women (WHO), and iron supplementation has been recommended as a public health approach to improve

maternal and infant health outcomes in different age groups (Anemia Mukht Bharat Training Tool Kit).

Figure 2.34: Showing Percentage of mothers provided full course of 180 Iron Folic acid tablets after Institutional delivery.

States above national average: The above figure shows national average of FY 2021-2022 however HMIS reported 18 states above the national average of 77%, namely Chandigarh, Meghalaya, Assam, Karnataka, Gujrat, Goa, Himachal Pradesh, Andhra Pradesh, Chhattisgarh, Lakshadweep, Madhya Pradesh, Maharashtra, Uttarakhand, Odisha, Rajasthan, Dadra & Nagar Haveli and Daman & Diu, Tamil Nadu and West Bengal.

In FY 2020-2021 18 states performing above the National average, namely Lakshadweep, Goa, Ladakh, Chandigarh, Himachal Pradesh, Gujrat, Assam, Meghalaya, Sikkim, Karnataka, Madhya Pradesh, chhattisgarh, Maharashtra, Tamil Nadu, Odisha, Rajasthan, Jharkhand, Dadra & Nagar Haveli and Daman & Diu.

Calcium Supplementation:

Adequate calcium intake during post-partum period has the potential to improve maternal bone mineral content, breast milk concentration.

The mineral accretion rate of a neonate reaches about 30–40 mg/kg per day, while calcium transfer between mothers and infants is on average 210 mg per day. (Olausson H., Goldberg G.R., Laskey M.A., Schoenmakers I., Jarjou L.M., Prentice A. Calcium economy in human pregnancy and lactation. *Nutr. Res. Rev.* 2012;25:40–67. doi: 10.1017/S0954422411000187. [PubMed] [CrossRef] [Google Scholar] [Ref list]) For babies who are breastfed exclusively through the first 6 months, the amount of mineral demand from the mothers is four times greater than that during 9 months of pregnancy.

The daily recommended dietary allowances (RDA) for calcium in pregnancy and lactation is 1200 mg per day. The National Nutrition Monitoring Bureau (NNMB) - 2012

data from 10 Indian states shows that the daily calcium intake during pregnancy and

National Guidelines for calcium supplementation during pregnancy and lactation

Oral swallowable calcium tablets to be taken twice a day (total 1g calcium/day) starting from 14 weeks of pregnancy up to six months post-partum.

lactation for Indian women is less than 30% of RDA (which means it is only 400 mg/d). This shows that most pregnant and lactating women in India have low dietary calcium intake.

Figure 2.35: Showing Percentage of mothers provided full course of 360 Calcium tablets after delivery to total institutional deliveries

It is observed that in 2021-2022 Chandigarh, Assam, Goa, Meghalaya, Karnataka, Himachal Pradesh, Gujrat and Utrakhnad is performing above the 90%. 18 States are above the national average. Arunachal Pradesh, Mizoram, Puducherry, Manipur and Tripura are below 40%.

It is also observed that the coverage of Iron folic acid is higher than the 360 calcium coverage in all states except in the State of Sikkim, Goa, Uttarakhand, Tamil Nadu, Telangana, Jharkhand, Kerala, Bihar and Nagaland where the coverage of calcium is found higher in FY 2021-2022.

In FY 2020-2021 also the coverage of 180 IFA is higher than 360 calcium in all states except in the State of Sikkim, Gujrat, Tamil Nadu, Kerala, Delhi, Nagaland, Haryana.

Figure 2.36: Showing Comparative Analysis of woman Provided 180 Iron Folic acid and 360 calcium after delivery

Comparative Analysis of woman provided 180 IFA & 360 calcium tablet after delivery.FY 2020-2021 (States falls below 50%)

CHAPTER 3

CHILD HEALTH

In India, an estimated **26 millions** of children are born every year. Children **0-6 years** age group accounts 13% (as per Census 2011) of the total population of country and nearly one fifth of the world's annual childbirths (as per UNICEF). Around **3.5 million** babies in India are born too early and more than one million new-borns are discharged each year from Special New-born Care Units (SNCUs). The newborn delivered early and those who are admitted in SNCU are at high risk and need focused care.

The Child Health programme under the National Health Mission (NHM) comprehensively integrates interventions that improve child survival and addresses factors contributing to infant and under-five mortality.

Critical services are made available through community outreach and through health facilities at various levels (primary, first referral units, tertiary health care facilities). The newborn and child health are now the two key pillars of the Reproductive, maternal, newborn, child and adolescent health (RMNCH+A) strategic approach, 2013.

Around 40% percent of neonatal deaths happen during delivery or first 24 hours of birth, which are preventable if skilled health care is provided and delivery conducted at institution. In addition, early initiation and exclusive breast-feeding aids in survival rates of a new born. Child survival is interlinked with the health of the mother

Child health goals under SDG (Sustainable Development Goals) Goal 3.2: By 2030, end preventable deaths of newborn and children under 5 years of age, with all countries aiming to reduce neonatal mortality to at least as low as 12 per 1000 live births and under-5 mortality to at least as low as 25 per 1000 live births.

Table 3.1 Child Health Goals under NHP-2017 and SDG-2030

Child Health Indicator	Current Status (SRS)	NHP 2017	SDG 2030
Neonatal Mortality rate	20, SRS 2020	16 BY 2025	=<12
Infant Mortality Rate	28, SRS 2020	28 BY 2019	----
Under 5 Mortality Rate	32, SRS 2020	23 BY 2025	< 25

Source: Sample Registration System 2020

3.1 Child Health Indicators

a. Infant Mortality Rate:

Infant mortality represents an important component of under-five mortality. Like under-five mortality, infant mortality rates measure child survival. They reflect the social, economic and environmental conditions in which children (and others in society) live, including their health care. Mortality rates are often used to identify vulnerable populations. In addition, infant mortality rate is an MDG indicator.

The infant mortality rate is the number of infant deaths for every 1,000 live births. It gives us key information about maternal and infant health hence infant mortality rate is an important marker of the overall health of a society.

As per the **Sample Registration System 2020**, the IMR at all India level is 28 per 1000 live births in 2020. The trend of Infant mortality at all India level is provided in Figure 3.1, which shows around **33%** decline in Infant Mortality Rate is observed in India during 2012 to 2020.

Figure 3.1: Trend of Infant Mortality Rate from 2012 to 2020 at All India Level

Source: Sample Registration System

b. Neo-natal Mortality Rate:

Mortality during the neonatal period accounts for a large proportion of child deaths, and is considered a useful indicator of maternal and newborn neonatal health and care. The probability that a child born in a specific year or period will die during the first 28 completed days of life if subject to age-specific mortality rates of that period, expressed per 1000 live births. Neonatal deaths (deaths among live births during the first 28 completed days of life) may be subdivided into early neonatal deaths, occurring during the first seven days of life, and

late neonatal deaths, occurring after the seventh day but before the 28th completed day of life

Neo-natal Mortality Rate (NMR) is defined as a number of deaths of children during the period of 0-28 days per 1000 live births. NMR stands 20 per 1000 live births in India in 2020 as per **Sample Registration System 2020**. Around 31% decline in Neo-natal Mortality Rate has been observed in India during 2012 to 2020.

The trend of Neo-natal Mortality Rate at all India level is provided in Figure 3.2

Figure 3.2: Trend of Neo-natal Mortality Rate 2012 to 2020 at All India Level

Source: Sample Registration System

c. Under-five Mortality Rate

Similar to the infant mortality rate, the mortality rate of children aged under 5 years is a baseline indicator of how a country is progressing towards assuring children's rights - in particular, their rights to life, health care services, nutrition, water, social security and protection. Under-5 mortality rate is a leading indicator of the level of child health and overall development of country.

Under-five mortality is defined number of deaths of children in the age 0-5 years per 1000 live births. As per the **Sample Registration System 2020**, the under five-mortality rate is 32 per 1000 live births in 2020. Around 39% decline in Under-five mortality Rate observed in India during 2012 to 2020. The trend of Under-five Mortality Rate at all India level is provided in Figure 3.3.

Figure 3.3: Trend of Under-five Mortality Rate 2012 to 2020 at All India Level

Source: Sample Registration System

*Under **National Health Mission (NHM)**, the programme of **home based and facility based** care for the newborn was launched to complete the continuum of care from facility to community.*

Health Management Information System (HMIS) collects data on around **100** data elements related to **Child health** only. They are covered under various programs sub components like *Pregnancy Outcomes, Home Based New Born Care (HBNC), Sick Newborn Care Units (SNCUs), Rashtriya Bal Swasthya Karyakarm (RBSK), Nutrition Rehabilitation Centre (NRC), Janani Shishu Suraksha Karyakram (JSSK), Weekly Iron folic acid (WIFS) Junior, Childhood Diseases and Death.*

3.2 Home Based New Born care (HBNC): For reduction of neonatal mortality, Home Based New Born Care implemented since 2011. Home Based Newborn Care scheme for the reduction of neonatal mortality, has incentivized Accredited Social Health Activist (ASHA) for making visits to all newborns and their mothers according to specified schedule up to 42 days of life. ASHA records the weight, ensuring immunization, safety of mother & newborn and registration. The information is recorded in MCP cards & ASHA visit form.

Also, provision for extra care to all newborn discharged after treatment of sickness from Special Newborn Care Units (SCNU) and those who are born as preterm or low birth weight babies is being ensured through structured home visits follow up by ASHA till 1 year of life. In case of SNCU discharged newborns, the day of discharge is day one. The HBNC schedule (as per revised guidelines 2014) is as follow:

6 HBNC- Six visits in case of Institutional Deliveries (Days 3, 7, 14, 21, 28 & 42)

7 HBNC- Seven visits in case of Institutional Deliveries (Days 1, 3, 7, 14, 21, 28 & 42)

“During the HBNC visits”, services offered like essential care of new born, examination of the new born, early recognition of danger signs, stabilization and referral, Counselling of the mother for breast feeding, warmth, care of the baby, Immunization, post-partum care and use of family planning methods. Figure 3.4 representing States/UTs, which have shown an increase in total HBNC coverage during 2021-22 when compared to 2020-21.

Total HBNC coverage: All INDIA

Figure 3.4. Percentage of Total HBNC coverage to total Deliveries in States/UTs showing an increase during 2021-22 from 2020-21

In case of **home delivery**, every newborn require care at home and identifying danger signs. Therefore, home based care and management of illnesses is done through HBNC to all the home deliveries, which will also help in reducing neo-natal mortality. Various States/UTs have shown an increase (FY 2021-22) in seven HBNC for home deliveries from previous year (FY 2020-21) presented in Figure 3.5. In addition, 6% increase is shown at All India level.

Figure 3.5. Percentage of 7 HBNC coverage to total home deliveries in States/UTs showing an increase during 2021-22 from 2021-21

In **Institutional deliveries** where discharge happens after 48 hrs as per guidelines and women returns home and there are still chances of neonatal deaths. Therefore, HBNC is again required for the remaining critical period. There are States/UTs presented in the Figure 3.6 where an increase in HBNC coverage in case of Institutional deliveries is observed. At All India level 6% increase is seen in 2021-22 as per the reported data on HMIS when compared to previous year (FY 2020-21).

Figure 3.6. Percentage of 6 HBNC coverage to total Institutional deliveries in States/UTs showing an increase during 2021-22 from 2021-21

States/UTs wise total number of Home & Institutional Deliveries followed by 7 & 6 HBNC Visits respectively as reported in HMIS 2021-22 is provided at **Annexure-3.1**

3.3 Facility Based New Born Care (FBNC)

Facility Based Newborn Care (FBNC) programme is one of the key initiatives launched by the Government of India under the National Rural Health Mission and RMNCH+A Strategic programme to improve the status of newborn health in the country. However, HBNC increased the admission of sick new born but care of newborn was also required. Therefore, **Ministry**

of Health & Family Welfare, Government of India (MoHFW, GoI) established Facility Based New-born Care services in health care facilities at different levels so that facility based intervention aids to drop **Neonatal Mortality rate (NMR)**.

The various components of FBNC are following:

- a. Newborn Care Corners (NBCCs)** are established at all delivery points to provide essential newborn care. It is a dedicated space within the delivery room and located in every Labor Rooms (LR) and maternity Operation Theatres (OTs) and aims to provide immediate care to all newborns who require basic resuscitation and thermal care
- b. Newborn Stabilization Units (NBSUs)** are being established at all Community Health Centers/First Referral Units for management of selected newborn conditions and to stabilize serious and sick newborns before referral to higher centers.
- c. Special Newborn Care Units (SNCUs)** are established at district hospitals and sub district hospitals with annual delivery load more than 3000 to provide care for sick newborns, that is, all type of neonatal care except assisted ventilation and major surgeries.

3.3.1 Newborn Stabilization Units (NBSUs): The second level of care after NBCC is known as Newborn Stabilization Units (NBSU), which is located at the block level facilities to manage newborns who are sick but stable.

NBSUs are responsible to stabilize a sick baby before referring to a higher care center and being located at block level brings care nearer to homes/villages of sick babies. NBSUs deliver first level of care under the FBNC framework, would manage low birth weight infants ≥ 1800 grams - provide phototherapy, thermal care using radiant warmer and feeding assistance as needed.

As per HMIS data of 2020-21 & 2021-22, at all India level the –percentage of NBSU admission out of total live births reported is **3 percent**.

States/UTs wise percentage distribution of **NBSU admissions to total live births** is represented in Table 3.2.

Table 3.2 Percentage of NBSU Admissions to total Live Births in States/UTs during 2021-22

States Reporting =<3% NBSU admissions i.e. All India Average	Meghalaya, Maharashtra, WB, MP, Punjab, Ladakh, Arunachal Pradesh, Assam, Odisha, Puducherry, Sikkim, Jharkhand, UP, Manipur, Bihar, Haryana
States Reporting >3 & <10% NBSU admissions	HP, AP, Mizoram, Karnataka, Telanagana, Delhi, Rajasthan, J & K, Tripura, Uttarakhand, Chandigarh, Chattisgarh, TN, Goa, Gujarat
States Reporting >=10% NBSU admissions	Andaman & Nicobar Islands, Lakhadweep, DNH & Daman and Diu, Nagaland, Kerala

As per reported data, **NBSU admissions** against the reported pre-term babies in States/UTs reported in HMIS in 2021-22 shows that few of the States/UTs reported less than **45 percentage** of admissions when compared to pre-term live births. The representation is given in the **figure.3.7**.

Figure 3.7 State/UT- wise percentage NBSU Admission out of total pre-term new-borns 2021-22

States/UTs wise total live births, number of preterm newborns & NBSU admissions as reported in HMIS 2021-22 is provided at **Annexure 3.2**

3.3.2 Special Newborn Care Unit (SNCU):

The third level of care, the Special Newborn Care Units (SNCUs) located in district hospitals, Sub district Hospitals and tertiary care hospitals, targets the **Very Low Birth Weight (VLBW)** newborns below 1800 grams and/or those suffering from other serious conditions. SNCUs are set up to improve the new born health within first week of their survival which is considered to be the most crucial period of newborns life. Approximately **15%** of newborns require facility based care, thus under the FBNC program, Special Newborn Care Units (SNCUs).

Major admission criterion except weight, are Perinatal asphyxia, Apnea or gasping, Refusal to feed, Respiratory distress, Severe jaundice, Hypothermia, Central cyanosis, Shock, Coma, convulsion or encephalopathy etc.

SNCU is dedicated unit in labor room proposed to offer special care for sick newborns, which provides all essential neo-natal care except for assisted ventilation and major surgeries. Maximum of the deaths have been reported essentially in the first week of life thus for plummeting on IMR and under-5 mortality rates, it is imperative to cut down NMR indispensably during first week of life.

a. Admissions & Mortality in SNCUs

During the year **2021-22**, there were a total of **12,55,875** admissions reported from the SNCUs out of which **89,770** babies died giving an annual mortality rate in SNCU of **7.14%**. States/UTs wise distribution of the Inborn & Out born admission rate in the SNCUs (out of the total SNCU admissions) is represented in Figure 3.8 where variations in different States/UTs can be seen in the data reported on HMIS for the FY 2021-22.

Figure 3.8 State/UT wise percentage of Inborn & Out born SNCU Admissions during 2021-22

One of the key components of the National Health Mission is to provide every village in the country with a trained female community health worker- an **ASHA (Accredited Social Health Activist)**. An ASHA is a key pillar of NHM who works at the community level to provide the outreach health care services and motivate the beneficiaries to avail the health care services in the nearby facilities. Figure 3.9 shows the States/UTs wise percentage of newborns admission in SNCU referred by ASHA reported in HMIS during 2021-22. However, various States/UTs (Himachal Pradesh, Delhi, Andaman & Nicobar Islands, Chandigarh, Goa, Lakshadweep, Nagaland, Puducherry, Sikkim, The Dadra and Nagar Haveli and Daman and Diu) reported nil data.

Figure 3.9 States/UTs wise percentage of newborns admission in SNCU referred by ASHA reported in HMIS during 2021-22

District level Newborn Care services should be planned based on the target population and need, and strengthening of the NBCCs and NBSUs should be done simultaneously to ensure referral linkages for optimal utilization of the SNCUs.

SNCU admissions to total live births reported in HMIS when compared during 2020-21 & 2021-22, it can be seen that 19 States/UTs are showing an increase in admissions to previous year (Andaman & Nicobar Island, The Dadra And Nagar Haveli And Daman And Diu, Ladakh, HP, Tamil Nadu, WB, Kerala, Odisha, Tripura, Lakshadweep, Andhra Pradesh, Assam, Mizoram, Karnataka, MP, Nagaland, Chandigarh, Maharashtra & Arunachal Pradesh). While Delhi, Sikkim and Manipur are showing decline in the admission rate. However, 13 States/UTs have reported stable performance during both the years, J & K, Puducherry, Goa, MP, Rajasthan, Telangana, Meghalaya, Haryana, Chhattisgarh, Punjab, Gujarat, Jharkhand, UP & Bihar.

Figure 3.10 States/UTs wise percentage SNCU admissions to total live births reported compared for 2020-21 & 2021-22

Total mortality reported in SNCU is **7%** to total SNCU admissions. However, the neonatal deaths reported on HMIS are **57%** (out of total infant deaths) to total livebirths reported by States/UTs.

Despite low SNCU mortality, neonatal deaths (age-wise) reported out of total infant deaths reported are more than **50%** (in infant deaths) to live births reported shows that it is imperative to cut down NMR indispensably during first week of life. As per data, 5% of total infants are admitted in SNCU to total live births reported during 2021-22.

Table 3.3 shows States/UTs-wise deaths in the SNCU to the total admissions happened during 2021-22. States/UTs, which are showing the maximum percentage of deaths (more than

10%) are **Chhattisgarh, Bihar and Madhya Pradesh** followed by **Gujarat, Manipur, Mizoram, Tripura and West Bengal** where deaths are reported above 8 percent.

Table 3.3 State/UTs wise reported deaths in SNCU admissions during 2021-22

States/UTs	% Deaths from SNCU admissions
All India	7.1
Andaman & Nicobar Islands	1.6
Andhra Pradesh	4.4
Arunachal Pradesh	5.5
Assam	7.7
Bihar	12.8
Chandigarh	1.3
Chhattisgarh	13.2
Delhi	5.2
Goa	4.0
Gujarat	9.7
Haryana	2.2
Himachal Pradesh	4.0
Jammu And Kashmir	5.1
Jharkhand	5.3
Karnataka	7.1
Kerala	1.4
Ladakh	5.1
Lakshadweep	0.0
Madhya Pradesh	11.3
Maharashtra	7.0
Manipur	8.1
Meghalaya	6.1
Mizoram	9.8
Nagaland	7.7
Odisha	7.8
Puducherry	7.4
Punjab	2.3
Rajasthan	7.0
Sikkim	0.0
Tamil Nadu	5.7
Telangana	4.5
The Dadra And Nagar Haveli And Daman And Diu	3.1
Tripura	8.3
Uttarakhand	7.9
Uttar Pradesh	6.1
West Bengal	9.6

States/UTs wise total live births, Total admission SNCU, SNCU Admissions - referred by ASHA & SNCU deaths as reported in HMIS 2021-22 is provided at **Annexure 3.3**

3.4 Neo Natal and Infant Health:

3.4.1 Early Initiation of Breast feeding: Whether delivery takes place in an institution or at home initiating breastfeeding in the first hour of life where the newborn is significantly more likely to survive. The practice of early initiation can decrease the newborn mortality and morbidity, which should be an integral part of safe delivery procedure. Children who are exclusively breastfed are less likely to die from life threatening diseases.

In FY 2020-21 and FY 21-22 percentage of new born breast fed within 1 hr of delivery is more than 90% at All India Level including most of the States/UTs. However, few of the States/UTs have still shown percentages less than 85%, which is presented in figure 3.11.

Figure 3.11 States/UTs wise new borns breast fed within 1 hour of birth during 21-22 (reported less than 85%)

In addition to this, there are five States/UTs, which have shown decline in percentage of breast-feeding in FY 2021-22 in comparison to the 2020-21. In FY 2020-21, these States/UTs reported more than 90% of initiation of breastfeeding within 1 hr of delivery. However, in FY 2021-22 the States/UTs as shown in the figure, percentage declined below 90% presented in figure.

Figure 3.12 States/UTs showing decline in breastfed within 1 hour during 2020-21 & 2021-22

3.4.2 Low Birth Weight Infant (<2.5 Kg)

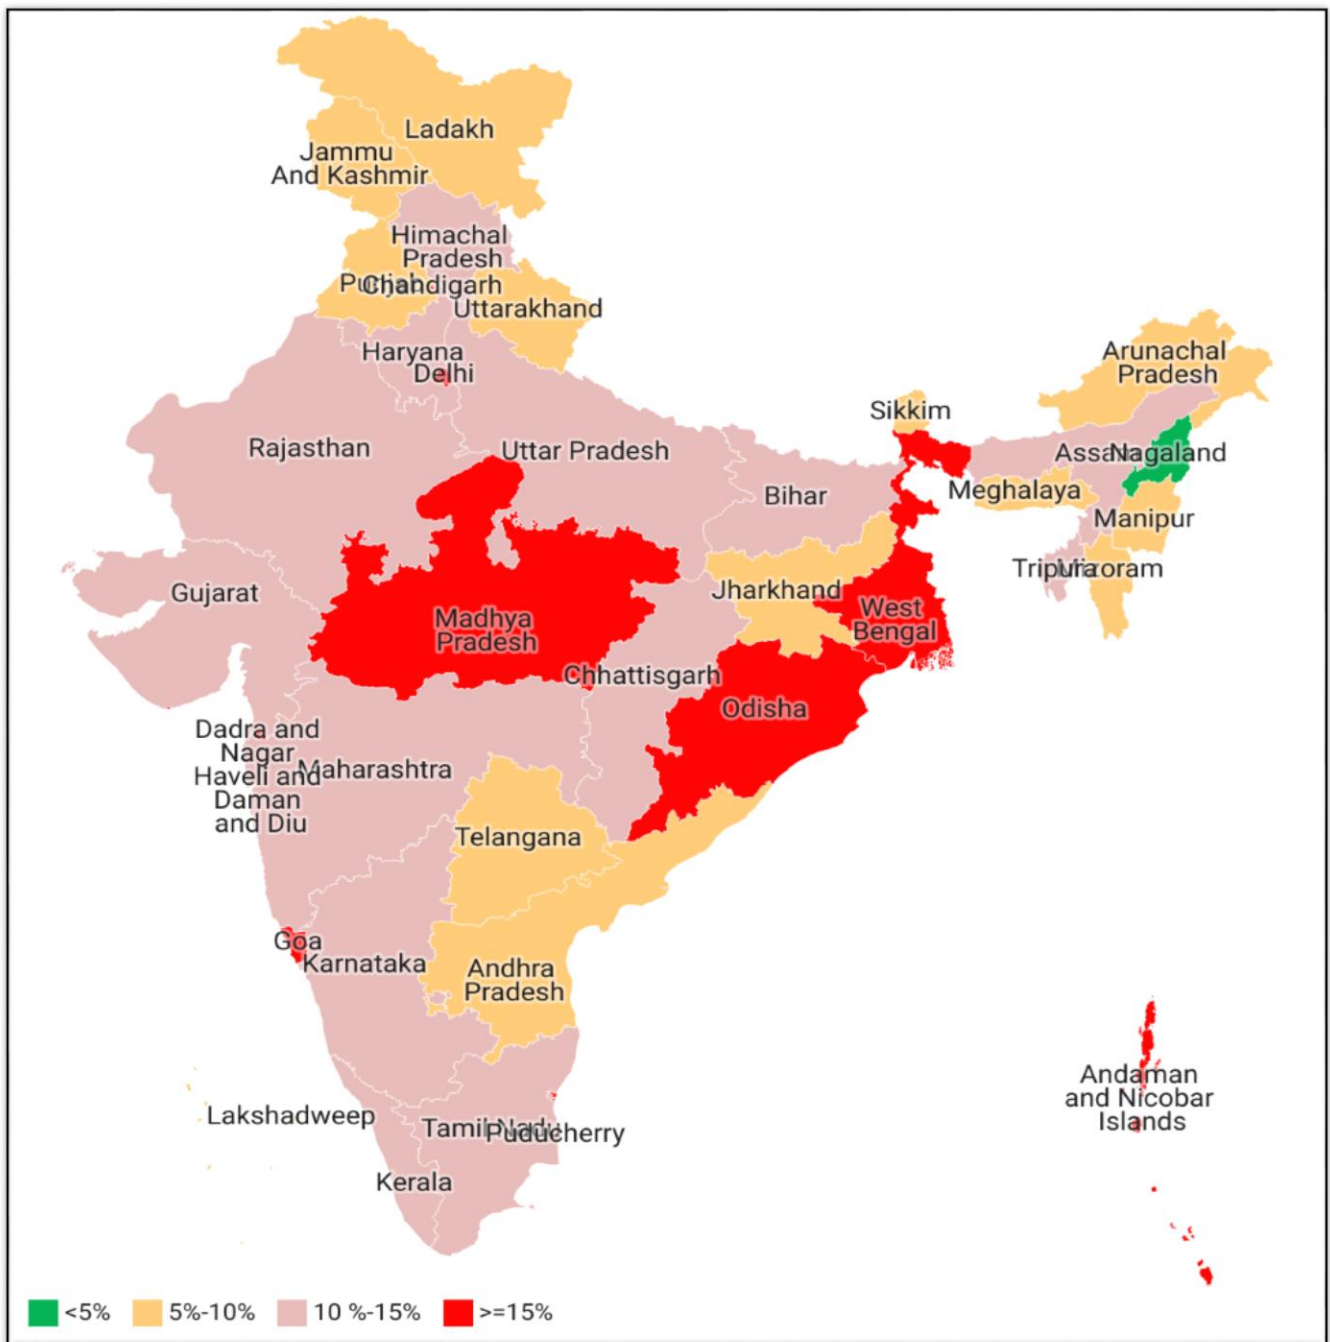

The weight of the newborn depends on the health of the mother during the pregnancy period. *A birth is considered as of low birth weight when the weight of the infant at birth is less than 2500 g (WHO).* Born with a low weight may elevate subsequent adverse health consequence for the infant. The immediate consequence of low birth weight is infant mortality, particularly in the first month of life. Some low-birthweight babies are healthy, but others have serious health problems that need treatment. Premature birth (before 37 weeks of pregnancy) and fetal growth restriction are the most common causes of low birthweight.

Women who went for more than four ANC visit has lesser chance of having low birth weight babies. The ANC visit for the women implies that they are being provided with necessary care during pregnancy, thus reducing chances of adverse pregnancy outcomes.

In India, 12.49 percent infants were found to be of low weight against those infants weighed at birth. However, State/UT wise representation on the geographical map is represented in figure 3.13 in the four ranges as provided below:

1. < 5% Low birth weight infants
2. >=5 to <10% Low birth weight infants
3. >=10 to <15% Low birth weight infants
4. >=15% Low birth weight infants

Figure 3.13 States/UTs wise Low Birth Weight Infants (<2.5 kg) during FY 2021-22

States/UTs wise total live births, Total New born weighed at birth, Newborns having weight less than 2.5 kg and newborns breast fed within 1 hour of birth as reported in HMIS 2021-22 is provided at **Annexure 3.4**.

3.4.3 Pre-term (High Risk) babies

Preterm birth (premature birth) is a significant public health problem across the world because of associated neonatal (first 28 days of life) mortality and short- and long-term morbidity and disability in later life. World Health Organization (WHO) defines preterm as babies born alive before 37 completed weeks of gestation or fewer than 259 days of gestation since the first day of a woman's last menstrual period (LMP).

In India, out of 27 million babies born every year (2010 data), 3.5 million babies born were premature. Newborn deaths (those in the first month of life) account for 40 percent of all deaths among children under five years of age. Preterm birth is the world's number one cause of newborn deaths.

More than three-quarters of preterm babies can be saved with inexpensive care such as essential care during child birth, antenatal steroid injections and postnatal care like kangaroo mother and basic care for infections and breathing difficulties.

Identification of risk factors in women with improved care before, between and during pregnancies; better access to contraceptives and increased empowerment/ education can further decrease the preterm birth rate (the number of preterm births divided by the number of live births).

Preterm newborns are classified based on completed gestation period as:

- Extremely Preterm – Less than 28 weeks
- Very Preterm – 28 to <32 weeks
- Late and Moderate Preterm – 32 to <37 weeks

Extremely preterm babies require neonatal intensive care for survival. Most of the other preterm babies have a good chance of healthy survival with special newborn care envisaged at sub district, district and medical college hospitals, coupled with facility based kangaroo mother care and home based newborn care.

Figure 3.14 shows 12 States/UTs, which have reported preterm to total live births more than equal to 5%. However, all remaining States/UT's reported less than 5% of preterm delivered during 2021-22.

Figure 3.14 States/UTs wise percentage reported ($\geq 5\%$) Pre term to total livebirths FY 2021-22

3.4.4 Still Birth Rate

A baby, who dies after 28 weeks of pregnancy, but before or during birth, is classified as a stillbirth. *The Still Birth Rate (SBR) is defined as the number of still births per 1000 total births (live birth + still birth).* As per WHO, there are nearly **2 million stillbirths** every year, one each 16 seconds. Over 40 per cent of all stillbirths occur during labour – a loss that could be avoided with improved quality during childbirth including routine monitoring and timely access to emergency obstetric care.

Experiencing a stillbirth during pregnancy or childbirth is a tragedy, there are psychological costs to women, especially women, and their families, such as maternal depression, financial consequences and economic percussions, as well as stigma and taboo.

The stillbirth rate is a key indicator of quality of care during pregnancy and childbirth India's Newborn Action Plan has articulated MOHFW vision and goal of "Ending preventable stillbirths to achieve "Single Digit SBR" by 2030, with all the states to individually achieve this target by 2030 with 4.4% average annual reduction rate (ARR) of Still Birth Rate.

Data reported in HMIS by States/UTs shows that the stillbirth-declining rate per 1000 births i.e. 11.79 during 2021-22, which was 15.5 in 2013-14 in India. Figure 3.15 presents the trend in the Still Birth rate declined around 24 percent at All India level.

Figure 3.15 Trend -Still birth rate based on HMIS data reported during 2013-14 to 2021-22

In 2021-22, at all India level, still birth rate (*Still births/Livebirths + Still Births*) is 11.79 percent, however it is observed that there are 15 States/UTs which have reported lower than the national average. The details of the States/UTs –wise percentage of Still Births as reported in 2021-22 is provided in Figure 3.16.

Figure 3.16 States/UTs wise Still Birth Rate 2021-22

Figure 3.17 representing 10 States/UTs, which have reported high still birth rate during 2021-22 when compared to 2020-21.

Figure 3.17 States/UTs reported an increase in Still Birth Rate during 2020-21 & 2021-22

States/UTs wise total live births, Total Still Births, and Total Births (Live plus Stillbirth) as reported in HMIS 2021-22 is provided at **Annexure 3.5**

3.5 Sex Ratio at Birth

This natural sex ratio at birth was the balance for decades before prenatal sex detection technology was introduced in the 1970s. When the natural sex ratio at birth prevails, about 48.8% of all children born were girls.

Sex ratio at Birth is defined as the number of females per 1000 males in the population and is an important social indicator to measure the extent of prevailing equity between males and females in a society at a given point of time. Child Sex Ratio is a very vital indicator to check the abnormalities, which are leading to imbalanced sex ratio. If the sex ratio is improved only at birth, then it would surely lead to increase in overall sex ratio in each age group up to 6 years of age. As per data reported on HMIS by States/UTs, wise Sex Ratio at birth is shown in figure 3.18.

Figure 3.18 Sex ratio at Birth during 2021-22

Sex ratio is more accurate and refined indicator of the extent of prenatal sex selection. Ministry of health & Family Welfare had passed an act 1994 as Pre-Conception and Pre-Natal Diagnostic Techniques (**PCPNDT) Act**, which emphasized to stop female feticides and arrest the

declining sex ratio in India. The act banned prenatal sex determination to promote the gender equality.

Sex ratio at Birth at all India level has increased by around 2 percent only from 918 (2013-14) to 934 (2021-22). Figure 3.19 presents the trend of Sex ratio at Birth at National level reported in HMIS during 2013-14 to 2021-22.

Figure 3.19 Trend- Sex ratio at Birth at All India Level

Figure 3.20 depicts those 11 States/UTs, contributing in decline trend of SRB during 2021-22 when compared to 2020-21.

Figure 3.20 States/UTs with declining SRB in 2020-21 w.r.t. 2021-22

	20-21	21-22
Bihar	915	898
Chandigarh	941	892
Haryana	927	920
Karnataka	949	940
Ladakh	973	943
Lakshadweep	948	939
Madhya Pradesh	940	929
Maharashtra	940	933
Manipur	954	945
Puducherry	985	957
West Bengal	949	944

State/UT-wise number of reported Live Births – Male, Live Births-Female and Sex Ratio at Birth as reported in HMIS during 2021-22 is provided at **Annexure 3.6**

3.6 Nutrition Rehabilitation Centre (NRC)

Nutritional Rehabilitation Centres (NRCs) are being set up in the health facilities for inpatient management of severely malnourished children, with counselling of mothers for proper feeding. The NRCs are facility based care units where severely acute malnourished (SAM) children below five years are admitted with their mothers/ care givers for treatment, stabilization and rehabilitation. The Mothers/ Care Giver stays with the children at the NRCs and attend counseling sessions on how to take care of the SAM child after discharge from the NRC. Special foods, nutritional supplements, medicines are administered according to the guidelines of Ministry of Health and Family Welfare. 19.8 million children below age 6 in India are undernourished (ICDS 2015).

Severe Acute Malnutrition (SAM) is an important contributing factor for most deaths amongst children suffering from common childhood illness, such as diarrhoea and pneumonia. SAM is an important preventable and treatable cause of morbidity and mortality in children below five years of age in India. A number of state governments have taken the lead and are in the process of scaling up the establishment of Nutritional Rehabilitation Centres (NRCs) with the intention to improve the quality of care being provided to children with SAM and to reduce child mortality.

The Major objectives of the NRC are:

1. To provide facility based management to children with SAM

2. To reduce under 5 mortality due to Severe Acute Malnutrition

There are two elements, which are captured under HMIS related to NRC. These include Number of children admitted in NRC and Number of children discharged with target weight gain from the NRCs.

As mentioned in Figure 3.21, at national level percent of Children discharged with target weight gain (against the children admitted) from the NRCs during 2021-22 is 59% which is showing a decline from 2020-21 which was reported as 61%. There are 17 States/UTs, which are showing children discharged with target weight gain higher than the national average reported on HMIS.

Figure 3.21: Percentage of Children discharged with target weight gain from the NRCs, States/UTs – as reported in HMIS during 2020-21 & 2021-22

State/UT-wise number of reported children admitted in NRC and discharged with target weight gain from the NRCs as reported in HMIS during 2021-22 is provided at **Annexure 3.7**

3.7 Rashtriya Bal Swasthya Karyakarm (RBSK)

Rashtriya Bal Swasthya Karyakram (RBSK) is a program to improve the overall quality of life of children enabling all children achieve their full potential; and also provide comprehensive care to all the children in the community. This program involves screening of children from birth to 18 years of age for 4 Ds- Defects at birth, Diseases, Deficiencies and Development delays, spanning 32 common health conditions for early detection and free treatment and management, including surgeries at tertiary level. Children diagnosed with identified selected health conditions are provided early intervention services and follow-up care at the district level. These services are provided free of cost, thus helping their families reduce out of pocket expenditure incurred on the treatment.

According to March of Dimes (2006), out of every 100 babies born in this country annually, 6 to 7 have a birth defect. This would translate to around 17 lakhs birth defects annually in the country and accounts for 9.6% of all the newborn deaths. Various nutritional deficiencies affecting the preschool children range from 4 per cent to 70 per cent. Developmental delays are common in early childhood affecting at least 10 percent of the children. These delays if not intervened timely may lead to permanent disabilities including cognitive, hearing or vision impairment. Also, there are group of diseases common in children viz. dental caries, rheumatic heart disease, reactive airways diseases etc. Early detection and management diseases including deficiencies bring added value in preventing these conditions to progress to its more severe and debilitating form and thereby reducing hospitalization and improving implementation of Right to Education.

Realizing the importance of Birth Defects and its implications on the affected individual, family and society, Ministry of Health & Family Welfare, Government of India under Rashtriya Bal Swasthya Karyakram (RBSK) initiated Newborn screening for Birth Defects at all delivery points with special focus on visible Birth Defects. Those Newborns identified with Birth Defects will be referred to higher centres for further evaluation and management.

Under RBSK initiative 0-6 year's age group will be specifically managed at District Early Intervention Center (DEIC) level while for 6-18 years age group, management of conditions will be done through existing public health facilities. DEIC will act as referral linkages for both the age groups.

First level of screening is done at all delivery points through existing Medical Officers, Staff Nurses and ANMs. After 48 hours until 6 weeks the screening of newborns will be done by ASHA at home as a part of Home Based New-born Care (HBNC) package. Outreach screening is done by dedicated Mobile Health teams for 6 weeks to 6 years at anganwadis centres and 6-18 years children at school. Once the child is screened and referred from any of these points of identification, it would be ensured that the necessary treatment/intervention is delivered at zero cost to the family. Health screening of children was a known intervention under the School Health Programme.

In Health Management Information System (HMIS), around 12 data elements related to Rashtriya Bal Swasthya Karyakram (RBSK) are being captured regarding screening for birth defect, screening by RBSK mobile team at Aanganwadi centers and schools, identification and management of Diseases, deficiencies and development delays.

i. Screening for Defect at Birth-

Child Health Screening and Early Intervention Services under NHM envisage covering **30 identified health conditions** for early detection and free treatment & management. Based on the high prevalence of diseases like hypothyroidism, sickle cell, anaemia and beta thalassemia in certain geographical pockets of some States /UTs, and availability of testing and specialized support facilities, States/UTs may incorporate them as part of this initiative.

At all India level, there were 2,03,38,078 live birth, of which 81,43,177 (40%) newborn were screened for defects at birth (as per RBSK) during 2021-22 in comparison to previous year 2020-21 which was 36%. 4 percent increase was observed during two financial years to total live births reported in the respective years. Figure 3.12 shows the Number of Newborns Screened for Defects at Birth.

Figure 3.22- Number of Newborns Screened for Defect at Birth during 2020-21 and 2021-22 (in Lakhs)

Figure 3.23 presents the percentage of newborns screened for defect at birth against total live birth as reported in HMIS during 2021-22. There are 20 States/UTs, which has reported more than national average i.e. 40%. These States includes Andhra Pradesh, Arunachal Pradesh, Assam, Chandigarh, Goa, Gujarat, Haryana, Himachal Pradesh, Jharkhand, Madhya Pradesh, Meghalaya, Odisha, Punjab, Tamil Nadu, The Dadra and Nagar Haveli and Daman and Diu, Tripura, Uttarakhand, Uttar Pradesh and West Bengal.

Figure 3.23- Percentage of Newborns Screened for Defect at Birth against Total Live Birth in India as Reported during 2021-22 (in Lakhs)

ii. Screening at Anganwadi Centers and Schools

As per RBSK Guidelines, Children aged 6 Weeks to 6 years are screened at Anganwadi Centres and children aged 6 years to 18 years are screened at Government and Government aided schools by dedicated Mobile Health Teams.

720.36 lakh children were screened in 2021-22 as reported in HMIS. The details on comparative Statement on Children Screened at Anganwadi Centers and Govt. and Govt. aided Schools in India as reported during 2020-21 and 2021-22 is provided in Table 3.4.

Table 3.4 Children Screened at Anganwadi Centers and Govt. and Govt. aided Schools in India as reported during 2020-21 and 2021-22

	2020-21	2021-22
Childrens screened at Anganwadi centres (6 month to 6 years)	111.44 Lakh	280.69 lakh
Childrens screened at govt. and Govt. added schools (6 years to 18 years)	112.37 Lakh	439.67 lakh
Total children screened (6 month to 18 years)	223.81 lakh	720.36 lakh

iii. Identification of Diseases, Deficiencies and Development Delay

The 'Child Health Screening and Early Intervention Services' Programme under Rashtriya Bal Swasthya Karyakram aims at early detection and management of the 4Ds prevalent in children.

Table 3.5 presents the bifurcation of children identified under RBSK program. As mentioned in table, out of total 720.36 lakhs children screened (6 months -16 years), 62.11 lakhs have been identified with diseases, deficiency and development delay.

Table 3.5 Children Identified at Anganwadi Centers and Govt./Govt. Aided Schools in India as reported during 2020-21 and 2021-22

	2020-21	2021-22
Children Identified with Diseases	10.45 Lakh	37.62 lakhs
Children Identified with Deficiencies	4.43 Lakh	16.11 lakh
Children Identified with Development Delay	3.04 Lakh	8.37 lakh
Total Children identified with Diseases, Deficiencies & Development Delays	17.93 lakh	62.11 lakh

iv. Management of 4Ds

Ministry of Health and Family Welfare (MoHFW) has signed MOUs with several Medical Colleges and private hospitals in order to conduct medical and surgical procedures for children in the age group of 0-18 years who suffering from various ailments for achieving the desired objective of RBSK program.

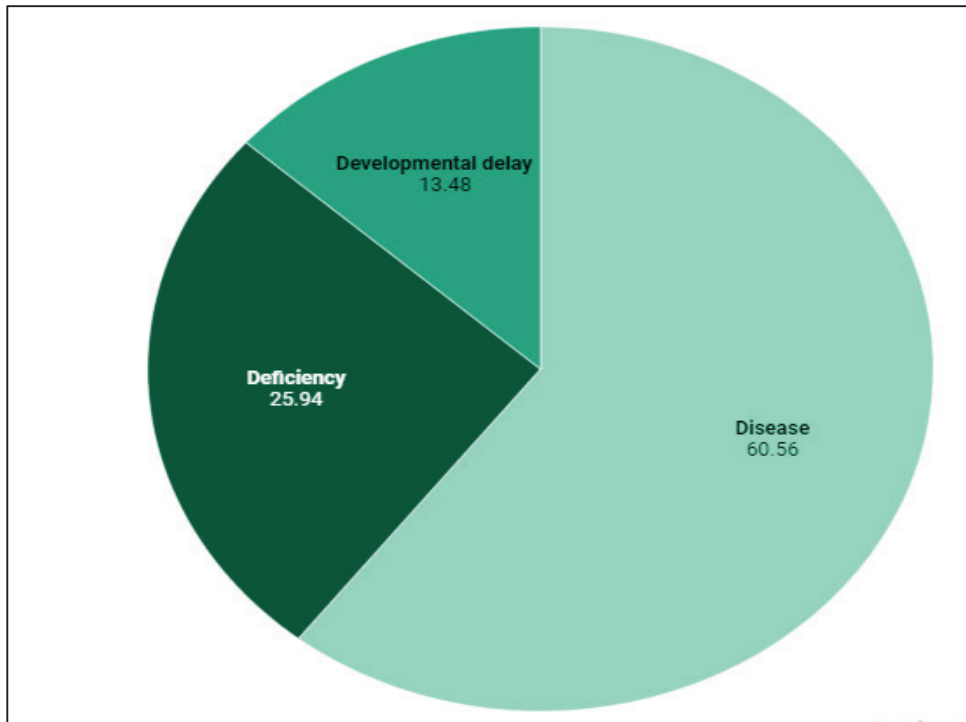

Figure 3.24 presents total Children Screened, Identified and management of 4Ds component under RBSK in India as reported in HMIS during 2020-21 & 2021-22. There are total, 62.11 lakh children identified with disease, Deficiency & Developmental delay and out of them 34.9 lakh children were managed by either medical intervention (34.34 lakh) or surgical intervention (5.64 lakh).

Figure 3.24 – Total Children Screened, Identified and Management of Disease, Deficiency & Developmental delay done under RBSK during 2021-21 and 2021-22 (in Lakhs)

Out of total 62.11 lakh children who were identified with Disease, Deficiency & Developmental delay; the bifurcations are represented in figure 3.25 which shows that 60.5 % children’s are identified with diseases (37.62 Lakh), 25.9 % children’s are identified with deficiencies (16.11 lakh) and 13.48 % children’s are identified with deficiencies development delays (8.37 lakh).

Figure 3.25 – Percentage distribution of Children identified with Disease, Deficiency & Developmental delay

State/UT-wise number of children screened, identified and management under RBSK as reported in HMIS during 2021-22 is provided at **Annexure 3.8**

3.8 Child Morbidity & Mortality

3.8.1 Child Morbidity

Child Morbidity is any departure, subjective or objective, from a state of physiological or psychological well-being (i.e. sickness or illness) within a child. Morbidity (common illnesses): Congenital anomalies, injuries, and non-communicable diseases (chronic respiratory diseases, acquired heart diseases, childhood cancers, diabetes, and obesity) are the emerging priorities in the global child health agenda.

Trends in morbidity and mortality in the children are important indicators of the status of health in a country. They also help in determining goals and allocating resources to areas of which needs more importance. Childhood morbidities are a major cause of mortality of children and the burden of child mortality from preventable and treatable diseases, which are treatable with simple interventions, is an important area of concern.

Malaria, respiratory tract infection and diarrheal diseases are the leading causes of childhood morbidity and mortality. In HMIS data is being captured for 12 Childhood diseases treated in **OPD** (Pneumonia, Asthma, Sepsis, Diphtheria, Pertusis, Tetanus Neonatrum, Tuberculosis,

Acute Flaccid Paralysis(AFP), Measles, Malaria, Severe Acute Malnutrition) and 2 Childhood Diseases treated in **IPD** (ARI and Diarrhoea).

In the OPDs among childhood diseases, the footfall for the diarrhea (76%) is the highest, which is also treated in IPDs. Pneumonia (12%) occurrence is the most, followed by Asthma (4%) and SAM (3%). Percentage occurrence of rest of all diseases is less than 5% to total OPD for childhood reported on HMIS. Figure 3.26 represents the bifurcation of percentage of OPDs among childhood diseases (cause wise) as reported in HMIS during 2021-22.

Figure 3.26 Cause – wise percentage distribution of OPDs among Childhood diseases during 2021-22

3.8.2 Infant & Child Mortality

Infant mortality is the death of an infant before his or her first birthday while Child mortality or the under-five mortality rate refers to the probability of a child dying between birth and exactly 5 years of age for every 1,000 live births. Infant mortality rate is of high importance when it comes to the health of a society.

As per UNICEF, globally infectious diseases, including pneumonia, diarrhoea and malaria, remain a leading cause of under-five deaths, along with preterm birth and intrapartum-related complications. Despite this considerable progress, improving child survival remains a matter

of urgent concern. In 2020 alone, roughly 13,800 under-five deaths occurred every day, an intolerably high number of largely preventable child deaths.

HMIS captures data on Mortality age wise and cause wise of child up to 5 years of age. The data captured under the following heads:

1. Infants upto 24 hours of age
2. Infant Deaths up to 4 weeks
3. Infant Deaths 1-12 months
4. Child Deaths 1-5 years

The figure 3.27 represents the States/UTs wise reported percentage total infant deaths to total live births reported above All India figure i.e., as reported on HMIS during FY 2020-21 & 2021-22.

Figure. 3.27 States/UTs wise percentage infant deaths reported during 2020-21 & 2021-22

Infant's deaths are bifurcated into three categories based on the age of the infants for data collection under HMIS. Based on the HMIS data as uploaded by States/UTs during the FY 2021-22 it is seen that based on the age group when the infant dies, maximum deaths (57%) are occurring during the neonatal period (within 28 days of post-partum), followed by the infant deaths (25%) occurring in post neonatal period and then infant deaths (18%) within 24 hours. Figure 3.28 represents the age wise bifurcation of the infant deaths reported during 2021-22.

Figure 3.28 Total Infant Deaths by Age group wise during FY 2021-22

Infant deaths up to 1 month (4 weeks)

The first 28 days of life – the neonatal period – is the most vulnerable time for a child’s survival. Infants are at highest risk of dying in their first month of life at an average global rate as per UNICEF- 17 deaths per 1,000 live births in 2020, down by 54 per cent from 37 deaths per 1,000 in 1990. Children who die within the first 28 days of birth suffer from conditions and diseases associated with lack of quality care at or immediately after birth and in the first days of life as the neonatal period is the most vulnerable time for a child.

As per 2021-22 HMIS data, infant deaths occurring up to 4 weeks of age excluding the deaths within 24 hrs are being reported for two main causes i.e. sepsis and asphyxia, rest all the deaths are reported under other causes. Out of two main causes which is captured by HMIS Asphyxia (22%) is the major reason for the infant deaths in this age group, followed by Sepsis (17%). However, all the other causes contribute 63% of neo-natal deaths.

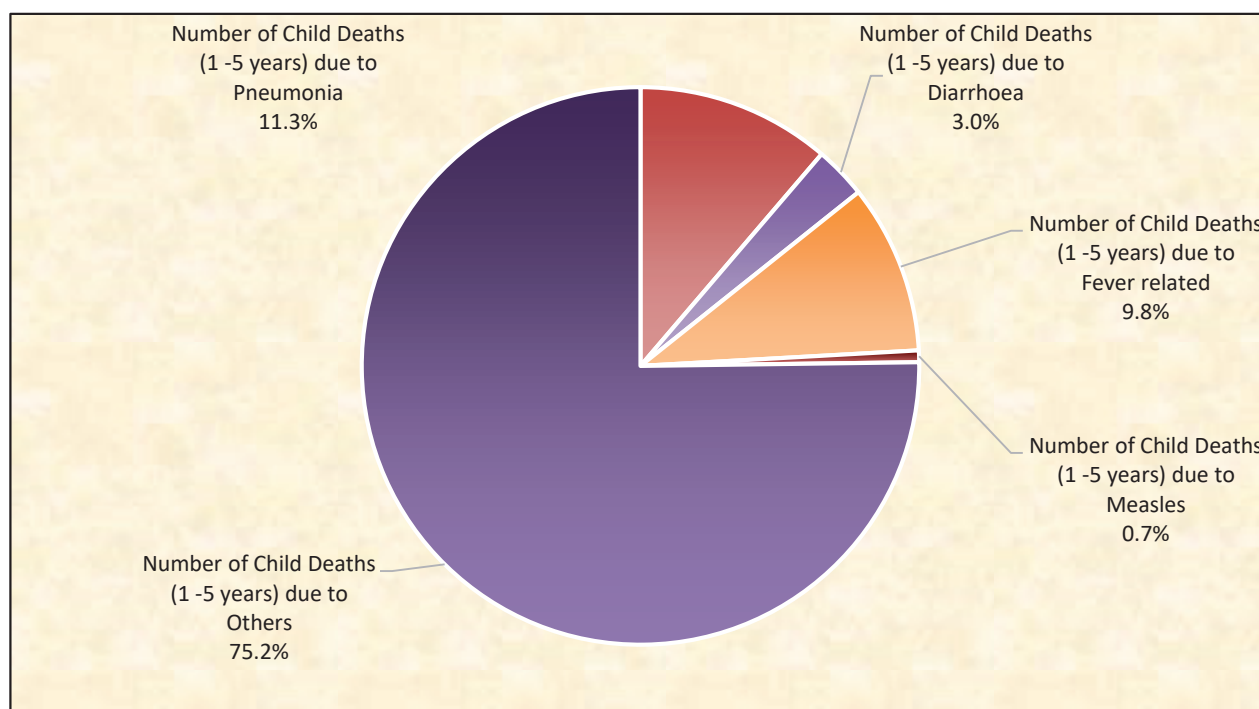

Figure.3.29 Infant deaths upto 4 weeks of age -by cause during FY 2021-22

Infant Deaths (1-12 months)

For the deaths reported in HMIS for the infants aged between 1 month and 12 months, other causes contribute 75% followed by Pneumonia (11%), fever-related (10%), Diarrhoea (3%) and Measles (1%). Figure 3.30 represents cause wise percentage of infant deaths (1-12 months) during 2021-22.

Figure 3.30 Percentage of infant deaths (1-12 months) - By Cause during FY 2021-22

State/UT-wise number of infant deaths cause -wise as reported in HMIS during 2021-22 is provided at **Annexure 3.9**

Child Deaths

Deaths of children aged 1 year to 5 years is captured in HMIS under four main causes and remaining causes are clubbed together while capturing the data from States/UTs. Various causes, which are available in HMIS, are as below:

- Pneumonia
- Diarrhoea
- Fever Related
- Measles
- Others

As per the data reported by States/UTs on HMIS for 2021-22, in the age group 1 yr to 5 yrs children maximum deaths in this age group are due to Pneumonia (18%), followed by Fever(7%), diarrhea(2%) and Measles(1%) out of the four main causes. Remaining deaths which are 80% are reported as others as a cause. Figure 3.31 represents the cause wise percentage of child (1 to 5 years of age) deaths reported.

Figure 3.31 Child Deaths (1-5 yrs of age) - By Cause during 2021-22

CHAPTER 4

IMMUNIZATION

Introduction

Immunization is the process whereby a person is made immune or resistant to an infectious disease, typically by the administration of a vaccine. Vaccines are substances that stimulate the body's own immune system to protect the person against subsequent infection or disease. Ministry of Health and Family Welfare, Government of India provides several vaccines to infants, children and pregnant women through the Universal Immunization Programme.

The Ministry of Health and Family Welfare, Government of India introduced Immunization Programme in India in 1978 as 'Expanded Programme of Immunization' (EPI). It was further renamed as Universal Immunization Programme in 1985 when its reach was expanded beyond urban areas included children upto 5 years and pregnant women. In 1992, it became part of Child Survival and Safe Motherhood Programme and in 1997, it was included in the ambit of National Reproductive and Child Health Programme.

Since the launch of National Rural Health Mission in 2005, Universal Immunization Programme has been an integral part of it. Universal Immunization Programme (UIP) of India is one of the largest public health programmes of the world implemented since 1985. It targets to cover around 2.67 crore newborns and 2.9 crore pregnant women annually. It is largely responsible for reduction of vaccine preventable under-5 mortality rate and maternal mortality (Source: NHM portal). The two major milestones of UIP have been achieved, one is elimination of polio in 2014 and 2nd is elimination of maternal and neonatal tetanus in 2015.

Under UIP, immunization is providing free of cost against 12 vaccine preventable diseases:

Nationally against 11 diseases - Diphtheria, Pertussis, Tetanus, Polio, Measles, Rubella, severe form of Childhood Tuberculosis, Rotavirus, diarrhea, Hepatitis B and Meningitis & Pneumonia caused by Hemophilus Influenza type B and Pneumococcal Pneumonia.

Sub-nationally against 1 disease - Japanese Encephalitis JE vaccine is provided only in endemic districts (Source: NHM portal).

A child is said to be fully immunized if child receives all due vaccine (BCG, three doses of Oral Polio Vaccine, three doses of Pentavalent vaccine and one dose of Measles) as per national immunization schedule within 1st year age of child.

The details of National Immunization Schedule under UIP is given in Table 4.1.

Table 4.1: National Immunization Schedule

Age	Vaccination schedule after Td introduction
At birth	BCG, OPV-zero dose, Hep B-birth dose
6 weeks	OPV-1, Pentavalent-1, Rota-1, fIPV-1, PCV-1
10 weeks	OPV-2, Pentavalent-2, Rota-2
14 weeks	OPV-3, Pentavalent-3, Rota-3, fIPV-2, PCV-2
9 months	Measles-1/MR-1, Vit A, JE-1*, PCV-B
16-24 months	DPT first booster dose, OPV-booster dose, Measles-2/ MR-2, JE-2*
5-6 years	DPT second booster dose
10 & 16 years	Td
For pregnant woman	Td-1 : early in pregnancy Td-2 : 4 weeks after Td-1 Td-B: if pregnancy occur within 3 years of last pregnancy and 2 Td doses were received

Note * JE endemic States/Districts

Government of India has expanded the basket of vaccines to include six new vaccines - Tetanus and adult Diphtheria (Td), Inactivated Poliovirus Vaccine (IPV) and Measles Rubella vaccine (MR), Rotavirus vaccine and Pneumococcal Conjugate Vaccine (PCV) at the national level and; Japanese encephalitis vaccine for adults at the subnational level.

Inactivated Polio Vaccine (IPV), introduced in November 2015 as part of Global Polio end-game strategy, to mitigate the risk associated with tOPV to bOPV switch.

Rotavirus vaccine (RVV): RVV introduced in March 2016 to reduce mortality and morbidity caused by Rotavirus diarrhoea.

Measles Rubella (MR) vaccine was introduced through campaign in 2017 targeting children in the age group of 9 months to 15 years (covering $\frac{1}{3}$ of the total population of the country) followed by 2 doses in routine immunization at 9-12 months and 16-24 months as part of goal of measles and rubella elimination by December 2023. Pneumococcal Conjugate Vaccine

(PCV): PCV launched in May 2017 for reducing Infant mortality and morbidity caused by pneumococcal pneumonia.

Tetanus & adult Diphtheria (Td) vaccine: Recommended by National Technical Advisory Group on Immunization (NTAGI) in 2016 due to epidemiological shift in age-group of diphtheria cases to school going children and adults. Thereafter, Td vaccine has replaced 2 doses of TT or single booster dose of TT given to pregnant woman and booster doses at 10 and 16 years of age.

Adult Japanese Encephalitis (JE) Vaccine: Japanese National Vector Borne Disease Control Programme (NVBDCP) had identified 38 Districts from Assam, Uttar Pradesh and West Bengal with high burden of JE in adult age group for Adult JE vaccination campaign.

With the aim to increase immunization coverage to 90%, the flagship program Mission Indradhanush (MI) was launched in December 2014, followed by the Intensified Mission Indradhanush (IMI) in October 2017 for reaching the dropout and left-out children for immunization in pockets of low immunization coverage. With special focus towards urban areas. As on May 2022, eleven phases of Mission Indradhanush have been completed covering 701 districts across the country.

In the National MIS portal of the Ministry of Health and Family Welfare, Government of India called '*Health Management Information System (HMIS)*', captures service delivery information reported primarily by public health facilities across country on monthly basis.

There are around 50 data items related to Immunization services provided by various health facilities captured in Health Management Information System (HMIS). The various vaccines received by infants 0 to 11 months includes BCG, DPT1, DPT2, DPT3, Pentavalent1, Pentavalent2, Pentavalent3, OPV-0 (Birth dose)OPV1, OPV2, OPV3, Hepatitis-B0 (Birth Dose), Hepatitis-B1, Hepatitis-B2, Hepatitis-B3, Inactivated Polio Vaccine 1 (IPV 1), Inactivated Polio Vaccine 2 (IPV 2), Rotavirus 1, Rotavirus 2, Rotavirus 3 and Pneumococcal conjugate vaccine PCV1, PCV2; Various vaccines received by Children 9 - 11 months which include Measles & Rubella (MR) – 1st Dose, Measles 1st dose, JE 1st dose and PCV Booster.

There are other vaccines related data items captured in HMIS which includes vaccines given to Children of more than 12 months- Measles & Rubella (MR) – 2nd Dose, Measles 2nd dose, JE 2nd dose, DPT 1st booster, OPV booster ; Children of more than 23 months- DPT 2nd booster, Td 10 and 16 at 10 and 16 years of age respectively; Adverse Event Following Immunization (AEFI), Number of Immunization sessions and Children received Vitamin A Doses between 9

months and 5 years, The analysis of some of the vaccines and immunizations coverage is provided in subsequent sections.

4. a. Immunization of Pregnant women/ mother against Tetanus and Diphtheria:

The use of Td is recommended during pregnancy to protect against maternal and neonatal tetanus & diphtheria during prenatal care. Vaccination during pregnancy also serves to boost immunity and increase the duration of protection to those pregnant women who had not received the full set of recommended booster doses.

Tetanus Toxoid (TT) vaccine has been replaced with Tetanus and adult diphtheria (Td) vaccine. Diseases like Tetanus and diphtheria can lead to hospitalizations or even cause death. The use of Td rather TT is recommended during pregnancy to protect against maternal and neonatal tetanus & diphtheria during prenatal care.

A pregnant woman is said to be fully immunized for Td, if she gets Td during her ANC visits (Td-1: early in pregnancy, Td-2: 4 weeks after Td-1 and Td-Booster: if pregnancy occur within 3 years). It is expected that programme should aim to achieve at least 90 percent Pregnant Women fully immunization for Td target in coming years. The details of Percentage of Pregnant Women fully immunized for T/Td at national level is given at Fig 4.1.

Figure 4.1: Trend of Percentage of Pregnant Women fully immunized for TT/Td at National during 2017-18 to 2021-22

At All India level, percentage pregnant women registered for ANC fully immunized for Td during 2020-21 (86.3%) and 2021-22(86.5%) was almost same (Fig 4.2). There are twenty States, which have reported above the national average during 2021-22. The top five States are following Andhra Pradesh (100%), Karnataka (100%), Tamil Nadu (99%), The Dadra and

Nagar Haveli and Daman and Diu (98%) and Maharashtra (97%). The Details of Percentage of Pregnant Women fully immunized for Td during 2020-21 to 2021-22 is provided in Fig 4.2.

Figure 4.2: Percentage Pregnant Women fully immunized for Td during 2020-21 to 2021-22 and States having greater than national average during 2021-22 (States/UTs with more than national avg. in 2021-22 considered)

States/UTs-wise number and percentage of Pregnant Women fully immunized for TT/Td during 2020-21 and 2021-22 is provided at Annexure-4.1.

4.2 Full Immunization of Children

A Child aged between 9 and 11 months is said to be fully immunized if they receive one dose of BCG, three doses of Pentavalent, three doses of Oral Polio Vaccines (OPV), and one dose of MR vaccine between 9-11 months of their birth.

The full immunization coverage is measured as proportion of number of children provided all due vaccines as per immunization schedule within 1st year of age against the estimated infants (0-1 year).

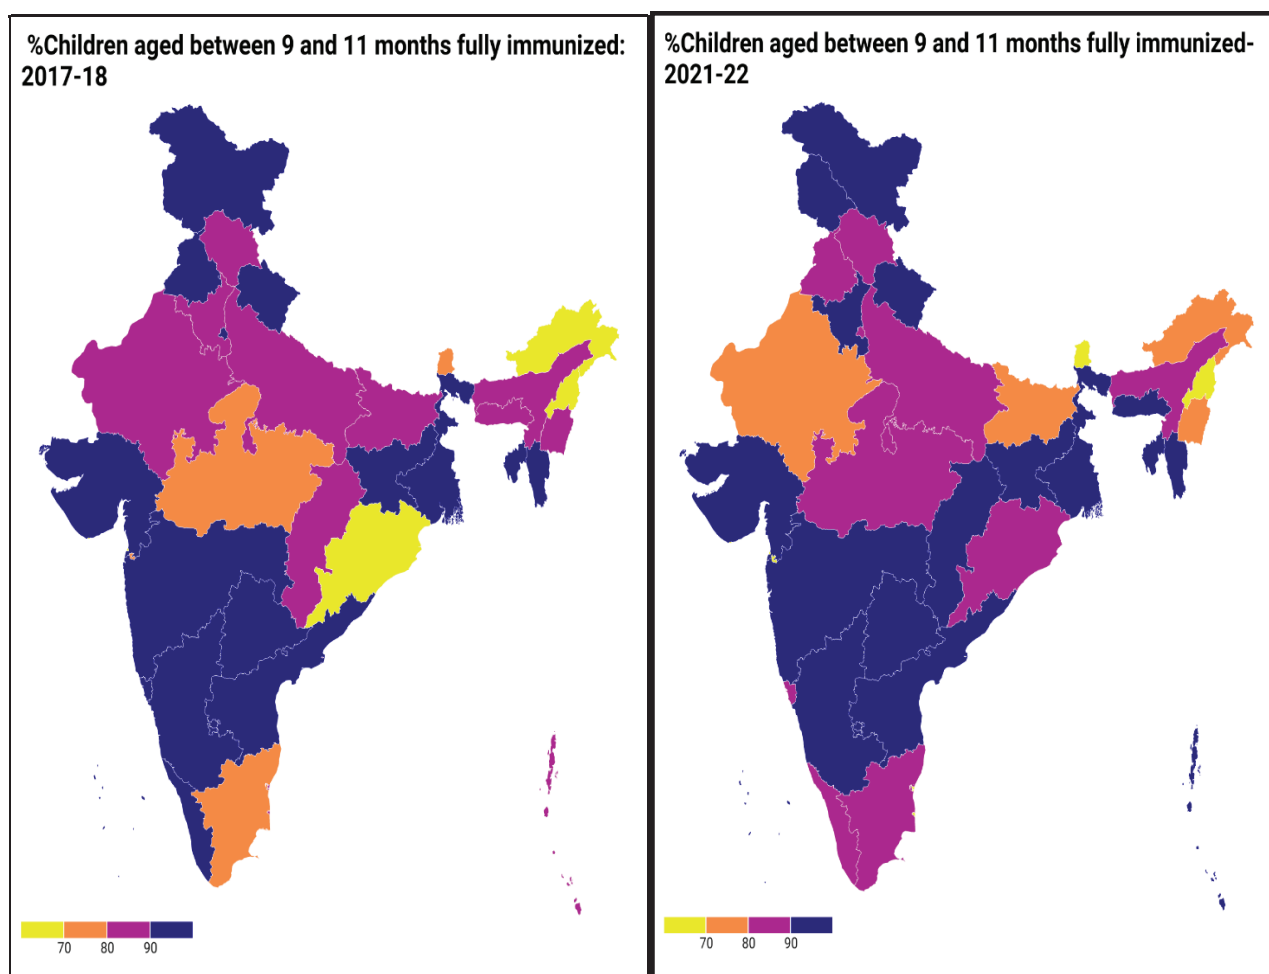

In HMIS, data element "Children aged between 9 and 11 months fully immunized- Male and Children aged between 9 and 11 months fully immunized- Female" are captured. The sum of Children aged between 9 and 11 months fully immunized- Male and Children aged between 9 and 11 months fully immunized- Female" is considered as total no. of children 9 to 11 months fully immunized.

4.2.i Full Immunization of Children (2017-18 vs. 2021-22):

While comparing the Childhood immunization in last 5 years from base year 2017-18 to 2021-22, it is observed that full immunization of children has been consolidated further and increased by around 3 percent in last five years. At the national level, Children aged between 9 and 11 months fully immunized was around 91%* in 2021-22 while same was around 88% in 2017-18. There were 17 States in 2017-18, which have reported 90%, and above with full immunization of Children. Same number of States have reported 90%, and above in 2021-22. Some of the selected five States, which have reported 90% and above in 2021-22 are Gujarat, Jammu and Kashmir, Telangana, Lakshadweep, and Andhra Pradesh.

The detail Comparative spatial analysis have been done. There are eight States/UTs, which included Bihar, Arunachal Pradesh, Rajasthan, Manipur, Sikkim, Puducherry and Nagaland and Dadra and Nagar Haveli and Daman and Diu, which have reported less than 80% full immunization of children in 2021-22 as compared to eight States/UTs (Madhya Pradesh, Tamil Nadu, Sikkim, Dadra & Nagar Haveli, Arunachal Pradesh, Odisha, Nagaland and Daman & Diu) in 2017-18. Fig. 4.3 shows Comparative maps of percentage of children aged between 9 and 11 months fully immunized during 2017-18 and 2021-22.

Figure 4.3: Comparative maps of Percentage of Children aged between 9 and 11 months fully immunized during 2017-18 and 2021-22

4.2. ii Full Immunization of Children (2020-21 vs. 2021-22):

While comparing the full immunization of children in 2021-22 with 2020-21, it is observed that during the Covid year (2020-21), Child Immunization at national level was 88.4%, which has increased to 91% in 2021-22.

There were nineteen States/UTs, which reported more than 90 percent Children fully immunized in 2020-21. In comparison to that in 2021-22, there are seventeen States/UTs, which have reported more than 90% full immunization of Children in 2021-22. Some of selected five States/UTs are following Andhra Pradesh, Gujarat, Jammu & Kashmir, Jharkhand, and Maharashtra.

The comparative performance of percentage full immunization of Children aged between 9 and 11 months greater than national average is presented in Fig 4.4.

Figure 4.4: States/UTs-wise Percentage of Children aged between 9 and 11 months fully immunized in 2020-21 and 2021-22 and States having greater than national average during 2021-22 (States/UTs with more than national avg. in 2021-22 considered):

States/UTs-wise number and percentage of Children 9 to 11 months fully immunized during 2020-21 and 2021-22 is provided at Annexure-4.2.

4.2.iii Measles and Rubella:

Measles is a highly infectious disease causing illness and death due to complications in the form of diarrhea, pneumonia or brain infection mostly among the children less than five years of age. Rubella is a mild disease but when infection occurs in early pregnancy, it has the potential to cause spontaneous abortions, fetal deaths, stillbirths and serious congenital defects in the child causing lifelong disabilities.

Measles Rubella vaccine is given for preventing both measles and rubella disease in the child. The first dose of Measles-Rubella vaccine needs to be administered, according to the National Immunization Schedule, after the completion of 9 months until 12 months of age while during 16-24 months the second dose shall be given.

HMIS captures children given Measles 1st dose and children given MR 1st dose (9-12 months), measles 2nd dose and MR 2nd dose (16-24 months Measles & Rubella (MR) - 1st Dose is provided between 9 to 11 months of age. As per HMIS reported data, there were 89.2% children in 2020-21 and 90.4 % children in 2021-22 were given Measles & Rubella (MR) - 1st Dose and Measles 1st dose at the national level.

There are 17 States/UTs which have reported 90% or above Child immunization (9-11months) - Measles & Rubella (MR)- 1st Dose and Measles 1st dose in 2021-22 while, there were 19 States have reported 90% or above Child immunization (9-11months) - Measles & Rubella

(MR)- 1st Dose and Measles 1st dose in 2020-21. State/ UTs wise coverage of Measles/ MR vaccination greater than national average is given in Fig 4.5.

Figure 4.5: Child immunization (9-11months) - Measles & Rubella (MR) - 1st Dose and Measles 1st dose during 2020-21 and 2021-22 and States having greater than national average during 2021-22 (States/UTs with more than national avg. in 2021-22 considered):

States/UTs-wise number and percentage of Children 9 to 11 months have received Measles & Rubella (MR) - 1st Dose and Measles 1st dose during 2020-21 and 2021-22 is provided at Annexure-4.3.

4.2. iv OPV-0 and Hepatitis-B Birth Dose:

Oral Polio Vaccine (OPV-0) Birth dose is made from live-attenuated Polioviruses. The vaccine is given as two drops into the child’s mouth. OPV-0 gives protection against the two types of Polioviruses (types 1, and 3) that cause Poliomyelitis (Polio) — a disease of the brain and spinal cord.

At All India level, there were 87.1 percent of Oral Polio Vaccine (OPV-0) Birth dose in 2021-22 as compared to 86.3 percent of Oral Polio Vaccine (OPV-0) Birth dose given in 2020-21. There are 20 States/UTs, which have reported more than 90 percent Oral Polio Vaccine (OPV-0) Birth dose in 2021-22 while there were 19 States/UTs during 2020-21 which have reported more than 90 percent OPV-0 Birth dose. The details of States/UTs-wise Percent of Child immunization - OPV 0 (Birth Dose) is provided at Fig.4.6.

Figure 4.6: States/UT-wise Percent of Child immunization - OPV 0 (Birth Dose) during 2020-21 and 2021-22

Hepatitis-B Birth Dose refers to the dose given to the children within 24 hours of their birth. A child vaccinated with Hep-B after more than 24 hours of birth is not considered to have received the birth dose. The birth dose of Hepatitis B vaccine is effective in preventing perinatal transmission of Hepatitis B only if given within the first 24 hours.

In 2020-21, percent of children received Hepatitis-B0 (Birth Dose) was 72.1 percent while in 2021-22, it was increased to 75.6 percent. There was eight States/UTs which have reported more than 90 percent children received Hepatitis-B0 (Birth Dose). Some of the States/UTs included Lakshadweep, Puducherry, Tamil Nadu, Andhra Pradesh and Telangana in 2020-21 and 2021-22. The details of States/UTs-wise Percent of Children received Hepatitis-B0 (Birth Dose) in Fig 4.7. Hepatitis B against Institutional Delivery was reported as 77.86% as per HMIS.

Fig 4.7: States/UT-wise Percent of Child immunization - Hepatitis-B0 (Birth Dose)

States/UTs-wise number and percentage of Child Immunization - OPV 0 (Birth Dose), Hepatitis-B0 (Birth Dose) during 2020-21 and 2021-22 is provided at Annexure-4.4.

4.2. v Pentavalent vaccination

Pentavalent vaccine provides protection to a child from 5 life-threatening diseases – Diphtheria, Pertussis, Tetanus, Hepatitis B and Hib. DPT (Diphtheria + Pertussis + Tetanus) and Hep B are already part of routine immunization in India; Hib vaccine is a new addition. Together, the combination is called Pentavalent. Hib vaccine can prevent serious diseases caused by Haemophilus influenzae type b like pneumonia, meningitis, bacteremia, epiglottitis, septic arthritis etc. Giving pentavalent vaccine reduces the number of pricks to a child, and provides protection from all five diseases.

Globally, Haemophilus influenza type b (Hib) bacteria kills more than 370,000 children under five every year. Nearly 20% of these children may die as well. Hib vaccine can prevent over a third of pneumonia cases and 90% of Hib meningitis cases.

India introduced pentavalent vaccine initially in two states viz. Kerala and Tamil Nadu in December 2011. Gradually it was expanded to all States/UTs. At present, it has been expanded to all States/UTs.

HMIS Captures pentavalent 1, pentavalent 2 and pentavalent 3. An analysis of Increase or decrease in pentavalent respective dose comparison from 2020-21 w.r.t 2021-22 is done. Same is provided below:

It can be observed that during 2020-21 to 2021-22, there is an increase (0.07%) in Pentavalent 1 doses administration, while there is decrease (-1.17%) in Pentavalent 2 doses administration and there is decrease (-2.54%) in Pentavalent 3 doses administration. There are eight States/UTs which has shown increase in administration of respective doses of pentavalent vaccines. States/UTs-wise number and percentage of Child immunization – pentavalent 1, 2 and 3 doses during 2020-21 and 2021-22 is provided at Annexure-4.5

Figure 4.8: States/UT-wise percent increase/decline in Pentavalent 1, Pentavalent 2 and Pentavalent 3 doses from 2020-21 to 2021-22.

4.2. vi Rotavirus

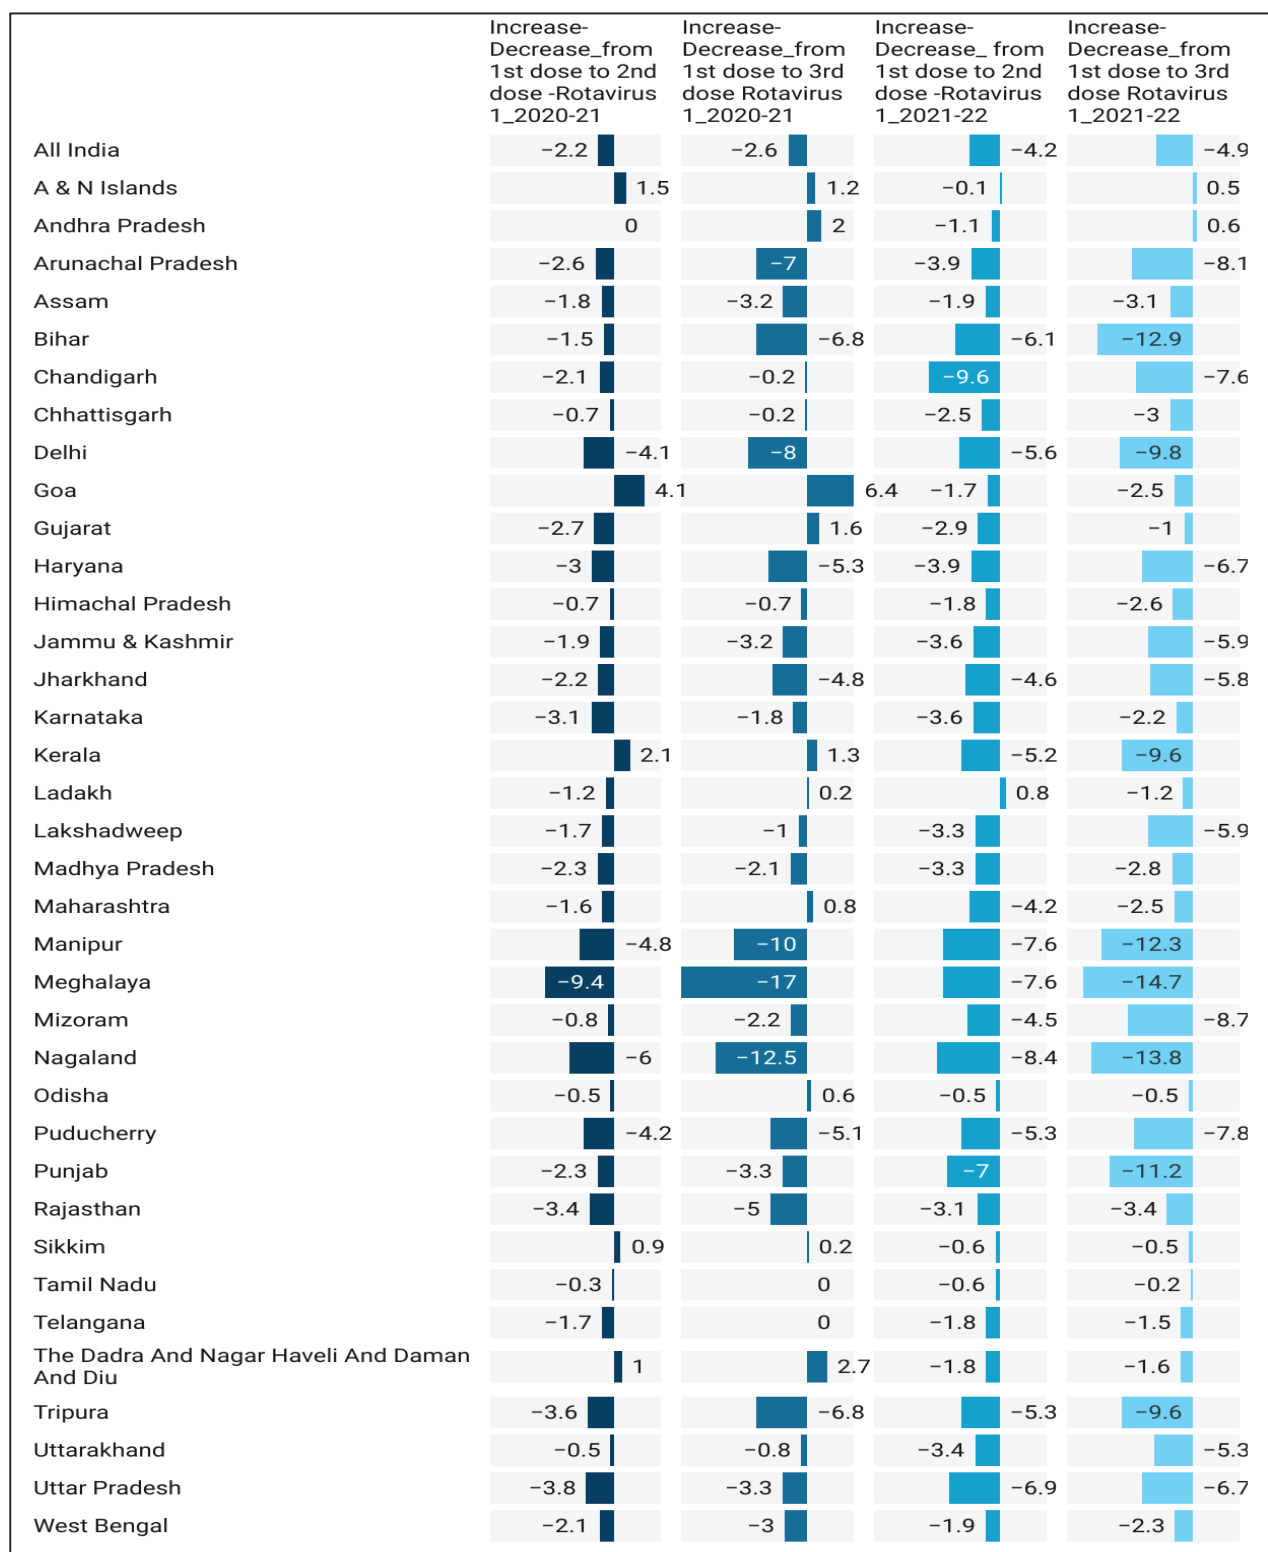

Rotaviruses are the most common cause of severe diarrhoeal disease in infants and young children worldwide. Rotaviruses is primarily transmitted by the faecal-oral route, rotaviruses affect the vast majority of children worldwide before the age of 3 years, and in most developing countries before the first birthday.

It is well known that diarrhoeal diseases are one of the most common causes for morbidity and mortality in children under 5 years of age. Among the diarrhoeal diseases, rotavirus infection is one of the most common causes for moderate to severe diarrhoea in children. The protection from Rotavirus infection is vaccination. In India, the Government of India has launched Rotavirus Vaccine (RVV) in 2016. In phased in manner it was rolled out across the country.

To see the dropout in administration of rotavirus 1 to rotavirus 2 and rotavirus 1 to rotavirus 3, during 2020-21 and 2021-22, a comparative analysis with charts is made. Based on the Fig 4.9, it is observed that highest drop out in Rota 1 to Rota 2, was observed in 3 northeastern States Manipur (-4.8%), Nagaland (-6%), Meghalaya (-9.4%). Similarly, highest dropout was observed in Rota 1 to Rota 3 in same three northeastern States Manipur (-10%), Nagaland (-12.5%), Meghalaya (-17%) in 2020-21.

During 2021-22, Rota 1 to Rota 2, highest dropout was observed in four States, Chandigarh (-9.6%), Manipur (-7.6%) and Nagaland (-8.4%). Rota 1 to Rota 3, these three States showed highest dropout, Bihar (-12.9%), Nagaland (-13.8%), Meghalaya (-14.7%) in 2021-22. The Comparative Decline from 1st dose to 2nd dose -Rotavirus and 1st dose to 3rd Dose during 2020-21 and 2021-22 is provided in Fig. 4.9.

Figure 4.9: States/UT-wise Comparative Decline from 1st dose to 2nd dose - Rotavirus and 1st dose to 3rd Dose during 2020-21 and 2021-22:

States/UTs-wise number and percentage of Child Immunization - OPV 0 (Birth Dose), Hepatitis-B0 (Birth Dose) during 2020-21 and 2021-22 is provided at Annexure-4.6.

4.3 AEFI

Adverse Events Following Immunization (AEFI) defined as any untoward medical occurrence following immunization and which does not necessarily have a causal relationship with the usage of vaccines. These events may include one or more unfavorable or unintended sign, symptoms or laboratory findings which raises concern among immunization program managers, policy makers, family of beneficiary and the community.

AEFIs can be common and minor (like fever, local pain and swelling), severe (like pain and swelling which spreads beyond the nearest joint or high-grade fever) and serious AEFIs (conditions requiring hospitalization or leading to death or disability).

In HMIS, at present, three data items are captured for AEFI, Number of cases of AEFI – Abscess, Number of cases of AEFI – Death and Number of cases of AEFI – Others.

As per reported data in HMIS, there were 213 and 155 AEFI deaths were reported across India respectively in 2020-21 and 2021-22. There are 13 States that have reported nil AEFI deaths in 2020-21, while there are 19 State/UTs in 2021-22, which have reported nil in 2021-22.

Bihar 59(28%), West Bengal 25(12%), Maharashtra 16(7%) and other States/UTs which have reported at least one AEFI deaths was 51(24%) were highest AEFI deaths reported States/UTs in 2020-21 and while Uttar Pradesh 36(23%), Bihar and Karnataka 18(12%) each, West Bengal 15(10%) and other States/UTs which have reported at least one AEFI deaths was 30(19%) were highest AEFI deaths reported States/UTs during 2021-22.

The State/UT-wise distribution of AEFI deaths for those who have reported AEFI deaths in HMIS during 2020-21 and 2021-22 is provided in Fig.4.10

Figure 4.10: State/UT-wise Distribution of AEFI Deaths Reported in HMIS during 2020-21 and 2021-22.

States/UTs-wise number Distribution of AEFI Abscess, Deaths and Others Reported in HMIS during 2020-21 and 2021-22 is provided at Annexure-4.7.

Conclusion:

Based on the analysis of programme data of Immunization reported through HMIS, it can be said that, although, during the pandemic year 2020-21, there was slight dip; however, it has increased again during 2021-22. Over the last five-year period, Coverage of immunization in Children and Pregnant women has increased substantially from 2017-18 to 2021-22. AEFI related deaths due to Immunization has also declined in 2021-22 w.r.t 2020-21.

CHAPTER 5

FAMILY PLANNING

5.1 Introduction

There are several definitions of family planning. An Expert Committee (1971) of the WHO defined family planning as "a way of thinking and living that is adopted voluntarily, upon the basis of knowledge, attitudes and responsible decisions by individuals and couples, in order to promote the health and welfare of the family group and thus contribute effectively to the social development of a country".

Another Expert Committee defined and described family planning as follows: "Family planning refers to practices that help individuals or couples to attain certain objectives:

- (a) to *avoid unwanted* births;
- (b) to *bring about wanted* births;
- (c) to *regulate the intervals* between pregnancies;
- (d) to *control the time at which births occur* in relation to the ages of the parent
- (e) to determine the *number of children* in the family

In 1952, India became the first nation in the world to introduce a National Programme for Family Planning. The Family Planning Programme has transformed in terms of policy and actual programme execution from its historic start in 1952. The National Population Policy (NPP), introduced in 2000, brought a holistic and target-free approach that helped in the reduction of fertility to not only achieve population stabilization goals but also promote reproductive health, leading to reduction in maternal, infant, and child mortality and morbidity. There was a gradual transition from the clinical approach to the reproductive child health approach.

Family Planning is a major pillar of the RMNCAH+N strategy. The program has come a long way since its inception with introduction of many new schemes and initiatives like "Mission Parivar Vikas" in 13 States (Seven high focus states and Six North Eastern States). Inclusion of new contraceptive methods (Injectable MPA and Centchroman pills), operationalization of FPLMIS for logistic and supply chain management of contraceptives, focus on post pregnancy contraception and many more. As a result, TFR and CBR have fallen significantly and FP indicators have improved substantially.

Figure 5.1: Total Fertility Rate (TFR) and Crude Birth rate, Year on Year-India

Source: Sample Registration Survey

Figure 5.2: MCPR and Unmet Need

Source: NFHS III, IV, V

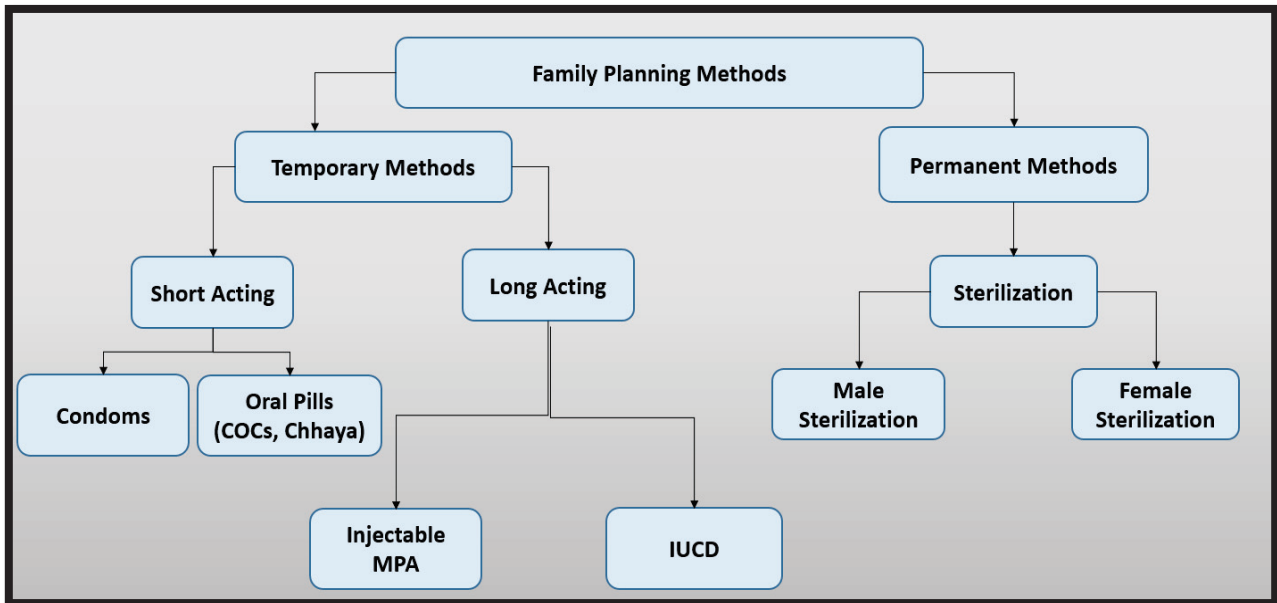

From the figure 5.2 it may be identified that MCPR (Modern Contraceptive Prevalence Rate) is increasing and Unmet need is continuously decreasing.

5.2 Contraceptive Methods under National Family Planning Program

Contraceptive methods are, by definition, preventive methods to help women avoid unwanted pregnancies. They include all temporary and permanent measures to prevent pregnancy resulting from coitus.

The Department of Health and Family Welfare is responsible for implementation of the National Family Welfare Programme by inter alia, encouraging the utilization of contraceptives and distribution of the same to the States/UTs under Free Supply Scheme and through Public Private Partnership (PPP) under Social Marketing Scheme. Family planning allows people to have desired number of children and determine the spacing of pregnancies which is achieved through use of contraceptive methods. Different method of contraceptives available under National Family Planning as mentioned in figure 5.3.

Figure 5.3: Contraceptive Methods

5.3 Key Data Elements for Family Planning under HMIS

HMIS captures 25 data elements corresponding to family planning programme. These are as follows:

- Male Sterilizations -Non Scalpel Vasectomy (NSV) / Conventional Vasectomy conducted
- Female Sterilizations –
 - Number of Laparoscopic sterilizations (excluding post abortion) conducted
 - Number of Interval Mini-lap (other than post-partum and post abortion) sterilizations conducted
 - Number of Postpartum sterilizations (within 7 days of delivery by mini-lap or concurrent with caesarean section) conducted
 - Number of Post Abortion sterilizations (within 7 days of spontaneous or surgical abortion) conducted
- IUCD-
 - Number of Interval IUCD Insertions (excluding PPIUCD and PAIUCD)
 - Number of Postpartum (within 48 hours of delivery) IUCD insertions
 - Number of Post Abortion (within 12 days of spontaneous or surgical abortion) IUCD insertions
 - Number of IUCD Removals
 - Number of complications following IUCD Insertion
- Injectable Contraceptive-Antara Program-
 - First Dose
 - Second Dose
 - Third Dose
 - Fourth or more than fourth
- Number of Combined Oral Pill cycles distributed
- Number of Condom pieces distributed

- Number of Centchroman (weekly) pill strips distributed
- Number of Emergency Contraceptive Pills (ECP) given
- Number of Pregnancy Test Kits (PTK) used
- Complications following-
 - Male sterilization
 - Female sterilization
- Failures following-
 - Male sterilization
 - Female sterilization
- Deaths following-
 - Male sterilization
 - Female sterilization

5.4. Antara Programme- Injectable MPA Services

Injectable Contraceptive MPA (Antara Programme) was introduced in the National Family Planning program in 2016. More than **71.73 lakh** doses of Injectable Contraceptive MPA (Antara Programme) have been reported till 2021-22 from the time of its inception into the Family Planning Programme.

In the Year 2021-22, Injectable MPA 23.74 lakh doses were provided, which has improved by 22% when compared to 19.40 lakh doses provided in the Year 2019 -20.

Figure 5.4: Improvement in uptake of continuous doses of Injectable MPA in HMIS (2019-2022)

Maximum number of Injectable MPA doses in 2021-22 were reported by Uttar Pradesh (5.9 lakh) followed by West Bengal (4.01 lakh) and Rajasthan (3.15 lakh). States/UTs wise Injectable MPA doses is provided at Annexure-5.1.

The seven high focus States under Mission Parivar Vikas have contributed to 64% of the total Injectable MPA doses in 2021-22.

Figure 5.5: Total No. of Doses of Injectable MPA in Seven High Focus States during 2021-22 (as per HMIS Data).

5.5. IUCD Services

In the Year 2021-22, a total of 60.55 Lakh IUCDs were inserted including in comparison to the Year 2019-20(57 Lakhs) IUCD performance improved by 5% in 2021-22. States/UTs wise IUCD insertions is provided at Annexure-5.2.

Figure 5.6: Percentage Share of Interval IUCD, PPIUCD and PAIUCD in Total IUCD

5.5.a PPIUCD Services

- Overall share of PPIUCD in total IUCD in the year 2021-22 improved to 51%(increased from 43% in 2019-20) while PAIUCD share was 1% of total IUCD insertions.
- The PPIUCD acceptance rate has been steadily increasing in the country and more than tripled in last five years with PPIUCD acceptance rate of 24.4% in 2021-22 against 8.1% in 2015-16. More than 1.3 Crore PPIUCD insertions have been done in the country since the inception. This shows that more women are now accepting PPIUCD as a contraceptive choice post-delivery.

Figure 5.7: The share of PPIUCDs in total IUCD -HMIS (2018-2022)

Figure 5.8: Comparison of PPIUCD Performance in Lakh and PPIUCD Acceptance in percentage-HMIS (2015-22)

Figure 5.8 shows the year-on-year improvement in the insertion of PPIUCD and Increase in PPIUCD acceptance from the Year 2015-16 to 2021-22. States/UTs wise PPIUCD insertions is provided at Annexure-5.3.

Figure 5.9: Top 10 performing states in PPIUCD -2021-22

5.5.b Interval IUCD Services:

In the Year 2021-22, 28.75 lakh Interval IUCD insertions were reported. Although Interval IUCD has declined by 9% from 2019-20(31.68 lakhs) it has improved by 8% from 2020-21(26.63 lakh). States/UTs wise Interval IUCD is attached at Annexure-5.4.

Figure 5.10: As per HMIS Data-Top 10 States reported maximum numbers of Interval IUCD during 2021-22

5.5.c PAIUCD Services:

PAIUCD insertions improved by 6.5% from 65,737 in 2020-21 to 69,980 in 2021-22. PAIUCD acceptance rate for India in 2021-22 was 6.1% (out of the total abortions reported). States/UTs wise number of PAIUCD insertions is provided at Annexure-5.5.

Figure 5.11: Top 10 states reported maximum number of PAIUCD (HMIS) -2021-22

5.6 Sterilization Services

Due to the mobility restrictions as a result of Nationwide lockdown, sterilizations faced the maximum impact and the number of sterilizations saw a decline of 25.7%, from 33,52,979 in 2019-20 to 26,97,810 in 2020-2021.

In the year 2021-22, this decline was compensated to an extent and Sterilization improved by 11.6% from 26,97,810 in 2020-21 to 30,08,751 in 2021-22. States/UTs wise sterilization is provided at Annexure-5.6.

Figure 5.12: % Contribution in Total Sterilization 2021-22 (HMIS)

% of Method wise female sterilization is attached at Annexure-5.9

5.6.a Male Sterilization Services

In the Year 2021-22 Male Sterilization, 33,635 contributing to 1% of the total sterilization services provided in India. Although it has improved by 27% from 2020-21(26,424) it has declined by 38% when compared to 2019-20(54,239). States/UTs wise male sterilization is provided at Annexure-5.7.

Figure 5.13: Top 10 states reported maximum number of Male Sterilization (HMIS) -2021-22

5.6.b Female Sterilization Services

Female Sterilization improved by 11.4%, from 26.71 lakh in 2020-21 to 29.75 lakh in 2021-22. However, it is yet to reach to its pre pandemic level of 32.98 lakh in 2019-20. The Interval Sterilization contributed to 71% of the Female Sterilization followed by PPS which contributed to 24%. States/UTs wise female sterilization is provided at Annexure-5.8.

5.6.b.1 Post-Partum Sterilization (PPS)

In the year 2021-22 Post-Partum Sterilization reached to 7.20 Lakh, which is aquavit to its pre-epidemic level in 2019-20(7.22 lakh). The PPS share in Female Sterilization has been increasing continuously over last 5-6 years. It has reached 24.2% in 2021-22 from 19% in 2016-17.

Figure 5.14: Comparison of Percentage share of PPS in Female Sterilization – HMIS (2016-22)

The acceptance of post-Partum sterilization out of total institutional deliveries has maintained at an average of around 3.7%. States/UTs wise PPS out of total institutional deliveries as reported in HMIS for 2020-21 & 2021-22 is provided at Annexure-5.10.

Figure 5.15: Comparison PPS acceptance out of total institutional deliveries- HMIS (2017-2022)

Figure 5.16: Top 10 states reported maximum numbers of PPS-2021-22(HMIS)

5.6.c Post-Abortion Sterilization

The Post Abortion Sterilization has declined by 19% from 60,796 in 2019-20 to 49, 119 in 2021-22. The PAS acceptance rate has declined from 4.8% in 2019-20 to 4.3% in 2021-22. States/UTs wise PAS is provided at Annexure-5.11.

Figure 5.17: Comparison of PAS acceptance out of total abortions – HMIS (2017-22)

Figure 5.18: Top 10 states reported maximum number of PAS -HMIS (2021-22)

5.7 Short Acting Method

5.7 a. Centchroman (Chhaya Pills)

Centchroman (Chhaya pills) emerged as a popular contraceptive method of choice during the COVID-19 pandemic in almost all states. In 2021-22(76.5lakh), the number of stripes distributed doubled from 2019-20 (34.5 lakhs).

Figure 5.19: Comparison of Centchroman strips distributed (in Lakhs) – HMIS (2016-22)

The graph below highlights the top 10 states with maximum distribution of Centchroman in 2021-22. Uttar Pradesh is the leading State followed by West Bengal and Jharkhand in the distribution of Centchroman pills. It is noteworthy that southern states (like Karnataka, Tamil Nadu and Andhra Pradesh) where sterilization has remained a predominant choice also displayed substantial Centchroman distribution. States/UTs wise Centchroman is provided at Annexure-5.12.

Figure 5.20: Top 10 states reported maximum Centchroman (in Lakhs) HMIS-2021-22

5.7 b. Condom

In 2021-22 as reported in HMIS, 33.70 crore pieces of condoms were distributed across the country. Despite the pandemic, condom distribution witnessed an increase of 7.2% as compared to 2020-21.

Figure 5.21: Comparison of Condom pieces distributed (in Crores) – HMIS (2018-22)

U.P. followed by Rajasthan, Andhra Pradesh and West Bengal are the leading states in the distribution of condom in 2021-22 in the country. Though, Rajasthan, West Bengal, Punjab and Gujarat have witnessed decline in the distribution of condom in 2021-22 against previous

year condom distribution. States/UTs wise condom pieces distributed (in Crores) is provided at Annexure-5.13.

Figure 5.22: Top 10 states reported maximum Condom pieces' distribution (in Crores) HMIS-2021-22

5.7 c. Combined Oral Contraceptive Pills (COCs):

In 2021-22, 4.8 crore cycles of COCs were distributed across the country. COCs distribution witnessed an increase of 8.7% as compared to 2020- 21(4.4 crore).

Figure 5.23: Top 10 states reported maximum COCs(cycle) distribution (in Crores) HMIS-2021-22

West Bengal leads the country in COCs distribution followed by Uttar and Madhya Pradesh. Tripura, Uttarakhand, Lakshadweep and Andhra Pradesh have witnessed highest percentage increase in the distribution of COCs in 2021-22 against previous years (2020-21). States/UTs wise COCs (cycle) distribution (in Crores) is provided at Annexure-5.14.

Figure 5.24: Top 10 states reported maximum COCs(cycle) distribution (in Crores) HMIS-2021-22

5.8 Highlights of the Family Planning Programme in India

Over the years Family Planning program has been repositioned to not only achieve population stabilization goals but also reduce maternal, infant and child morbidities and mortalities. Pandemic years 2020-21 and 2021-22 were challenging years for all services including Family Planning.

The key programmatic highlights for the year 2020-21 and 2021-22 are as follows:

In spite of the huge challenges encountered on account of the pandemic, the programme was able to stand ground and barring a few expected setbacks specially in the reduction of sterilizations performed (since the OTs were closed in the initial peak period) was able to either improve or maintain its performance over the last two years in PPIUCD, Chhaya and Injectable contraceptives.

1. Growth in PPIUCDs performance was reported in 2020-21 and 2021-22. Performance of PPIUCD insertion improved on average of ~11.7%.
2. Injectable MPAs performance showed only a marginal decline of around 3% in 2020-21 but in the year 2021-22 the performance improved by ~26%.
3. Centchroman (Chhaya), the indigenously developed weekly contraceptive pill was an exemplifier across most of the states and its national performance more than doubled over the last year. In the year 2019-20 its distribution improved by 65% compared to 2019 -20 and in 2021-22, it further improved by 35% when compared with 2020-21.
4. The acceptance of PAIUCD in the Year 2020-21 declined by nearly 10% but in 2021-22, it has started improving and expected to reach to the Pre pandemic level.
5. Expectedly, due to the restrictions imposed and OTs being instructed to close for routine surgeries, sterilization services declined by ~ 20% but in 2021-22 it has started improving and reported a growth of ~11% compared to 2020-21.
6. The WPD fortnight 2020 too was observed, where there was increase in use of spacing methods both in 2020-21 and 2021-22.
7. The MPV districts performed better than their counterparts and contributed to 66% of all Injectable MPA administrations.
8. The failure and death rates following sterilization have also declined.

Chapter 6

ADOLESCENT HEALTH

What is Adolescence?

Adolescence is the phase of life between childhood and adulthood, from ages 10 to 19. It is a unique stage of human development and an important time for laying the foundations of good health. Despite being thought of as a healthy stage of life, during this phase, adolescents establish patterns of behaviour – for instance, related to diet, physical activity, substance use, and sexual activity – that can protect their health and the health of others around them, or put their health at risk now and in the future.

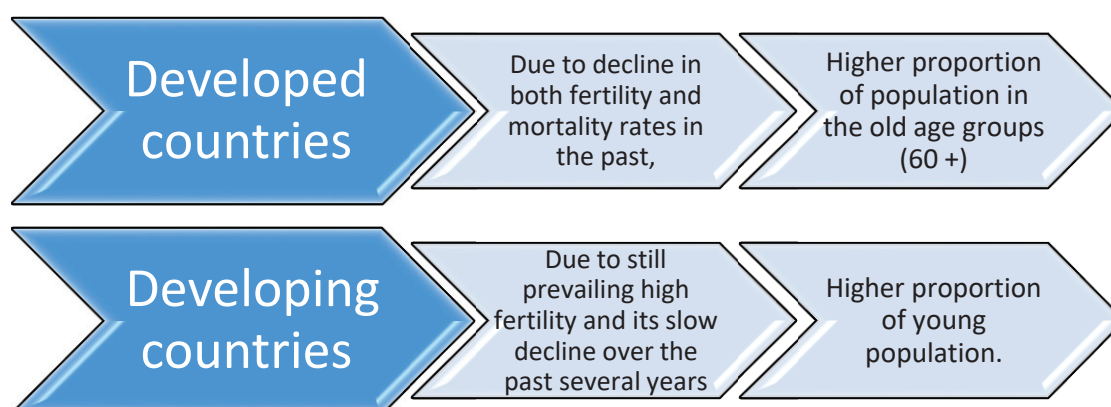

To grow and develop in good health, adolescents need information, including age-appropriate life skills education; health services that are acceptable, equitable, appropriate and effective; and safe and supportive environments. They also need opportunities to meaningfully participate in the design and delivery of interventions to improve and maintain their health. Expanding such opportunities is key to responding to adolescents' specific needs and rights.

Current Status

The total estimated population of the world in 2010 was 6.91 billion. The number of persons in the age group 10-19 years (defined as Adolescents) was 1.19 billion and that in the age group 15-24 years (defined as Youth) was 1.22 billion. Together, the adolescent and youth population (10-24 years) constituted about 1.82 billion (or 26.3%) of the total population in the world.

The population of the young varies from country to country depending upon rate of fertility and mortality levels of the population.

Figure 6.1: Adolescent Population in Developing and Developed countries

In India, as per Census 2011, adolescent population (10-19) is 253.2 million and that of the youth (15-24) is 231.9 million, constituting 20.9 per cent and 19.2 per cent of the total population respectively. The population of the young (10-24) is 364.6 million (30.1%). There has been a decline in the proportion of adolescent population and an increase of youth population compared to Census 2001.

Why focus on adolescents?

India has the largest adolescent population in the world, 253 million, and every fifth person being between 10 to 19 years. India stands to benefit socially, politically and economically if this large number of adolescents are safe, healthy, educated and equipped with information and life skills to support the country's continued development.

Both adolescent girls and boys lack access to information on issues affecting their lives and have limited spaces to develop competencies crucial for active participation. Adolescent girls, especially, are exposed to multiple layers of vulnerability due to pernicious social norms affecting the value of girls, which in turn affects their ability to move freely and to make decisions affecting their work, education, marriage and social relationships.

About 43 per cent of girls drop out before completing secondary education due to household responsibilities, marriage, child labour, limited relevance of education for employment and employability, distance to school and/or lack of sanitation facilities at the school. Menstruation disrupts the lives of girls in ways that are unimaginable in many countries. At least 42 per cent of girls in India use cloth rather than disposable sanitary napkins (*source unicef.org*).

Initiatives of MoHFW for Adolescents

To ensure holistic development of Adolescent Population, the Ministry of Health and Family Welfare launched Rashtriya Kishor Swasthya Karyakram (RKSK) on 7th January 2014 to reach out to 253 million adolescents including adolescent:

- male and female,
- rural and urban,
- married and unmarried,
- in and out-of-school adolescents
- with special focus on marginalized and underserved groups.

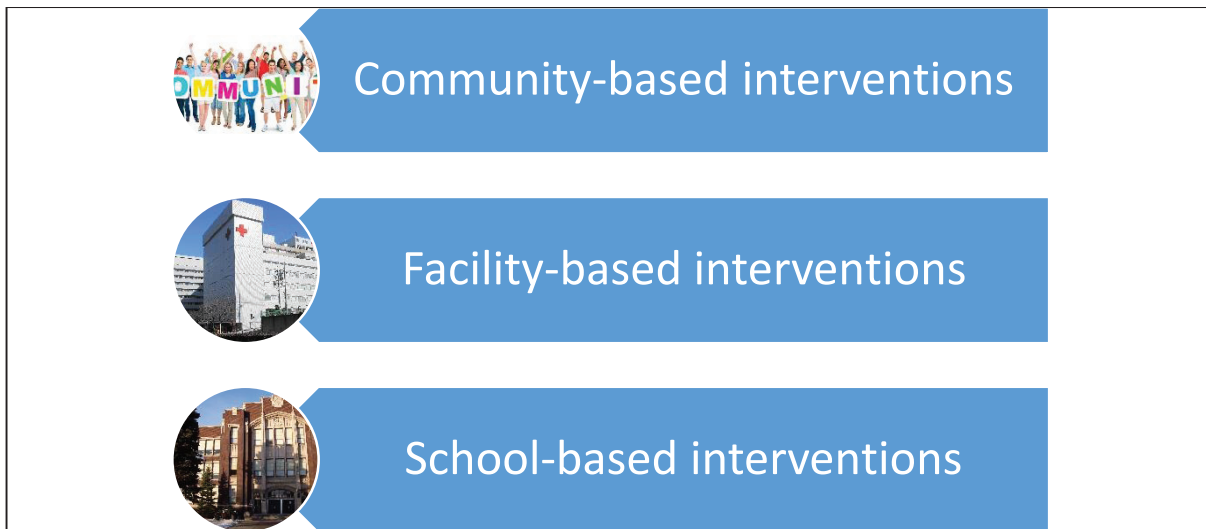

The expanded scope of adolescent health programming in India now include the below six thematic areas

- Sexual and reproductive health,
- Nutrition,
- Injuries and violence (including gender based violence),
- Non-communicable diseases,
- Substance Misuse,
- Mental health

The strength of the program is its health promotion approach. It is a paradigm shift from the existing clinic-based services to promotion, prevention and reaching adolescents in their own environment, such as in schools, families and communities.

The interventions under RKSK can be broadly grouped into three categories:

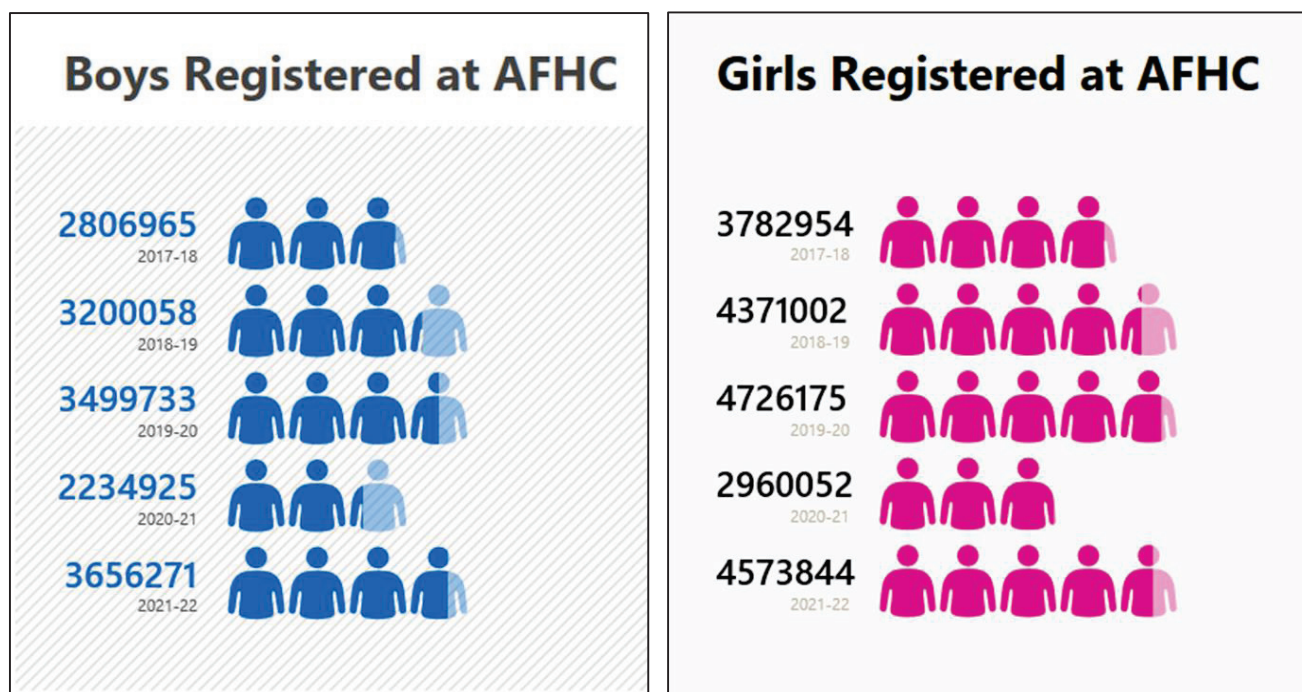

Figure 6.2: Interventions under RKSK

Adolescent Friendly Health Clinics (AFHC)

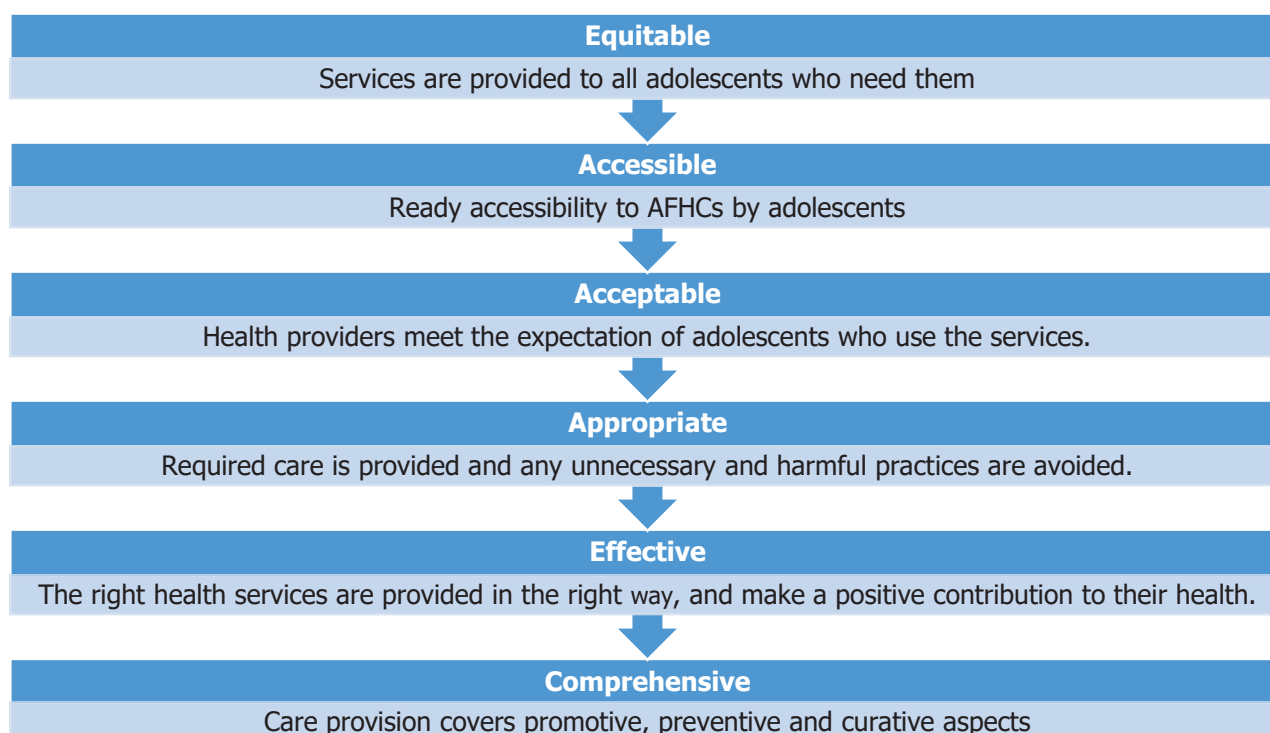

The approach, in the form of Adolescent Reproductive Sexual Health (ARSH) Clinics to provide counselling on sexual & reproductive health issues only was initiated in 2006 under RCH II. Now with the Rashtriya Kishor Swasthya Karyakram (RKSK) its facility based approach the programme has AFHCs which entail a whole gamut of clinical and counselling services on diverse adolescent health issues ranging from Sexual and Reproductive Health (SRH) to Nutrition, Substance abuse, Injuries and Violence (including Gender based violence, Non Communicable Diseases and Mental Health. These adolescent friendly health services are delivered through trained service providers- MO, ANM and Counsellors at AFHCs located at Primary Health Centers (PHCs), Community Health Centers (CHCs), District Hospitals (DHs) and Medical Colleges. Over the years there has been an increase in the number of boys and girls registered in AFHC with a drop appearing in the year 2020-21 owing to Covid-19.

**Figure 6.3 Number of boys and girls registered in AFHC
from 2017-18 to 2021-22**

The key 'friendly' component of AFHC mandates facility-based clinical and counselling services for adolescents, which are non-judgemental, empathetic alongside having the following too.

Figure 6.4 Components of an AFHC

During the year 2020-21, 52 lakh adolescents registered with the AFHCs, which increased to 82 lakhs during the year 2021-22. On comparing the adolescents registered per lakh estimated population for two years it can be seen that there has been a phenomenal increase in the figures which has increased from 383 to 601 during 2020-21 and 2021-22 (Table 6.1). The State/ UT-wise details are given at **Annexure 6.3 & Annexure 6.4**. Most of the states have registered an increase in the registration of adolescents at AFHCs except a few.

* Mid year population as on 1st October 2020 ** Mid year population as on 1st October 2021

Figures in red indicate a decline in data over the previous year

Figure 6.5 GIRLS VS. BOYS REGISTERED AT AFHCs 2020-21 and 2021-22

At all India level, among the total adolescents registered with the AFHC there has been an increase in the number of registrations in 2021-22 when compared to 2020-21. But, it can be seen that the percentage of girls registering at AFHC is more than Boys in both the years.

As per the programme guidelines after the girls and boys register with an AFHC there is a provision to provide counselling or Clinical Services to these adolescents. Following table depicts the % of girls and boys receiving Clinical and Counselling services respectively during 2 years.

Figure 6.6 Percentage of Adolescents receiving Clinical and Counselling services at AFHC 2020-21 and 2021-22

The state wise trends show that more than 60% adolescents are getting each clinical and counselling services at AFHC, except Kerala, Puducherry and Tamil Nadu where the total % of children receiving clinical and counselling services is less than the number of adolescents registered in 2021-22.

School Health & Wellness Programme

Schools play a critical role in helping students establish lifelong healthy behaviours. Recognizing the importance of this, school based health promotion activities have been incorporated as a part of the Health and Wellness component of the Ayushman Bharat Programme. School Health & Wellness Programme (launched in Feb 2020) is being implemented in government and government aided schools in select districts (including aspirational districts). Two teachers, preferably one male and one female, in every school, designated as “Health and Wellness Ambassadors” are trained to transact health promotion and disease prevention information on 11 thematic areas in the form of interesting joyful interactive activities for one hour every week to promote joyful learning among school children.

Weekly Iron folic acid supplementation (WIFS)

The Ministry of Health and Family Welfare has launched the Weekly Iron and Folic Acid Supplementation (WIFS) Programme to meet the challenge of high prevalence of anaemia amongst adolescent girls and boys. WIFS is evidence based programmatic response to the prevailing anaemia situation amongst adolescent girls and boys through supervised weekly ingestion of IFA supplementation and biannual helminthic control. The long term goal is to break the intergenerational cycle of anaemia, the short term benefit is of a nutritionally improved human capital. The programme, implemented across the country both in rural and urban areas, for both in and out of school adolescents.

The interventions in the programme include:

- Administration of supervised Weekly Iron-folic Acid Supplements of 60 mg elemental iron and 500ug Folic acid using a fixed day approach.
- Screening of target groups for moderate/severe anaemia and referring these cases to an appropriate public health facility.
- Biannual de-worming (Albendazole 400mg), six months apart, for control of helminthic infestation.
- Information and counselling for improving dietary intake and for taking actions for prevention of intestinal worm infestation.

The programme has been rolled out in all States/UTs. The programme covers 11.2 crore beneficiaries including 9.7 crore in-school and 1.5 crore out of school beneficiaries.

Adolescents provided Iron Folic Acid

Overall there has been increase in the number of adolescents provided 4 IFA in 2021-22 as compared to 2020-21, whereas a few states/ UTs have exhibited a decline i.e. Arunachal Pradesh, Himachal Pradesh, Odisha and Puducherry. Delhi has not reported any data for 2021-22. Lakshadweep has not reported any data during both the years for IFA provision. Sikkim has not reported any data for school going adolescents during both the years

The programme has been rolled out in all States/UTs. The programme covers 11.2 crore beneficiaries including 9.7 crore in-school and 1.5 crore out of school beneficiaries. The State/ UT-wise details are given at **Annexure 6.1**.

Figure 6.7 Percentage of Adolescents receiving Clinical and Counselling services at AFHC 2020-21 and 2021-22

Adolescents provided Albendazole

At All India level a decline of around 8% has been noticed in provision of Albendazole to adolescents including School going Girls, Boys and out of school girls. The same has been mainly contributed by Andhra Pradesh, Bihar, Chattisgarh, Gujarat, Haryana, Himachal Pradesh and Uttar Pradesh who have reported more than 40% decline in 2021-22 as compared to 2020-21.

Lakshadweep has not reported any data for both of the years, whereas 6 States/ UTs did not report data during 2020-21 which include A&N Islands, Delhi, Kerala, Ladakh, Meghalaya and Sikkim, whereas during 2021-22 these States/ UTs have reported data on albendazole provision to Adolescents. The State/ UT-wise details are given at **Annexure 6.2**.

Figure 6.8 Comparative Adolescents provided Albendazole 2020-21 and 2021-22

Menstrual Hygiene Scheme:

The Ministry of Health and Family Welfare is implementing a scheme for promotion of menstrual hygiene among adolescent girls in the age group of 10-19 years since 2011. The major objectives of the scheme are:

1. To increase awareness among adolescent girls on Menstrual Hygiene
2. To increase access to and use of high quality sanitary napkins to adolescent girls
3. To ensure safe disposal of sanitary napkins in an environmentally friendly manner.

For implementation of the Scheme, funds are now being provided to States/UTs under National Health Mission based on the proposals received from them in their Programme Implementation Plans, for decentralized procurement of sanitary napkin packs. These are provided to the adolescent girls at a subsidized rate of Rs 6 for a pack of 6 napkins by the ASHA, who is responsible for distribution, receiving an incentive @ Rs 1 per pack sold and a free pack of napkins every month for her own personal use. She convenes monthly meetings at the Anganwadi Centres or other similar platforms for adolescent girls to focus on the issue of menstrual hygiene and other relevant SRH issues. The data for all these 3 indicators related to Menstrual Health Scheme is captured in the HMIS.

As per the data reported on HMIS, 14 States/ UTs viz. Andaman & Nicobar Islands, Arunachal Pradesh, Chandigarh, Chhattisgarh, Goa, Ladakh, Lakshadweep, Manipur, Meghalaya, Nagaland, Puducherry, Sikkim, Telangana, The Dadra And Nagar Haveli And Daman And Diu are not reporting any data for Adolescent Girls provided sanitary napkin packs during 2020-21.

Whereas during 2021-22, 6 states among these have initiated reporting on this indicator these states are Manipur, Meghalaya, Nagaland, Sikkim, Telangana and The Dadra And Nagar Haveli And Daman And Diu. The State/ UT-wise details are given at **Annexure 6.5 & Annexure 6.6.**

CHAPTER 7

DIAGNOSTIC SERVICE

The Vital Role of Diagnostic Services in Healthcare: Efficient and effective diagnostic services, both radiological and pathological, are amongst the most essential health care facilities for delivering quality treatment to the public.

Diagnosis is the first step to disease management, which helps in accurate identification and treatment. The word diagnosis has not probably received so much attention and acclaim as it has now, during a worldwide pandemic, when detection and timely treatment have clearly emerged as the need of the hour. Diagnosis helps improve patient care, contributes to protecting a patient's health and in some cases even helps limit healthcare spending.

It is a medical procedure that involves testing a sample of blood, urine, stool, sputum, tissues etc. Diagnostic services facilitate the provision of timely, cost effective & high quality diagnostic care in a safe & secure environment. It includes Clinical services of Pathology, Laboratory, medicine, radiology & nuclear medicine. Diagnostics are an integral part of the health care system, which provide information needed by service providers to make informed decisions about care provision related to prevention, screening, detection, treatment and management.

Currently HMIS captures data related to diagnostics services related of various procedures such as Hb test, HIV, RTI/STI, Syphilis, Widal test, X-ray and Ultrasound etc. Some of the HMIS data Items Analysis pertinent to the same is provided below:

7.1 Laboratory Investigations:-

Lab investigations constitute an important part of diagnostic evaluation of any patient for gathering information and it is a known fact that with the help of investigation some underlying systematic conditions of patients can be identified which they were not aware of. Lab tests includes examination of Blood, urine and other specimens.

From figure 7.1, it can be seen that the total Number of laboratory tests conducted and reported at the India level throughout the year shows an increasing trend.

Figure 7.1 Increasing trend of Total Laboratory Investigation (in Cr.) reported in HMIS at All India level over the years.

Laboratory Services & Investigation:

A number of data elements w.r.t Lab tests are captured in HMIS. **Figure 7.2** shows percentage of tests performed at hospital, where maximum number of tests have been conducted for Haemoglobin, which is more than 40% in Both FY 2020-21 and 2021-22 followed by Malaria.

Types of Lab test conducted and captured under HMIS is:

- 7.1.1 Haemoglobin (HB)
- 7.1.2 HIV Test
- 7.1.3 Syphilis Test
- 7.1.4 Widal Test
- 7.1.5 Malaria Test
- 7.1.6 RDT Test

Figure 7.2 Showing Percentage of Laboratory Investigations By Type.

7.1.1 Haemoglobin (HB)

A Haemoglobin test measures the levels of Haemoglobin in the blood. A protein in the red blood cells carries oxygen from lungs to the rest of the body. If the haemoglobin levels are abnormal, it may be a sign of disorder in the body. The ranges given below:

Table 1: Ranges of Anemia (in g/dl)

Population	Anemia		
	Mild	Moderate	Severe
Children 6–59 months of age	10–10.9	7–9.9	<7
Children 5–11 years of age	11–11.4	8–10.9	<8
Children 12–14 years of age	11–11.9	8–10.9	<8
Non-pregnant women (15 years of age and above)	11–11.9	8–10.9	<8
Pregnant women	10–10.9	7–9.9	<7
Men (15 years of age and above)	11–12.9	8–10.9	<8

Source: WHO- Nutritional Anemia: Tools for Effective Prevention and Control, 2017

Figure 7.3 Percentage of tested cases having Hb<7 (g/dl) above National average (3.07 for FY 2020-21 & 3.06 for FY 2021-22):

Around 11.3 Crore and 8.3 Crore Hb tests were performed in FY 2021-22 and FY 2020-21 respectively. State/ UT-wise details given in Annexure 7.3. In Figure 7.3 shows, 12 states have reported higher than National average i.e. more than 3.07 percent during the FY 2020-21 with Chandigarh being the highest at 8.22%, followed by Telangana at 6.38% and Jammu & Kashmir at 5.33% on the other hand, in FY 2021-22 Puducherry, Telangana and Jammu & Kashmir has reported high number of anemic patients.

Below graphs represents, States reporting less than the National average of 3.07%. In FY 2021-22 Lakshadweep, Goa followed Manipur by exhibit lessening the anemia cases as compare to National Average. Whereas, Tripura and Nagaland also shows major reduction in anemia cases compare to 2020-21.

Figure 7.4 Percentage of Hb<7 cases to total tested cases reported by State Below National Average.

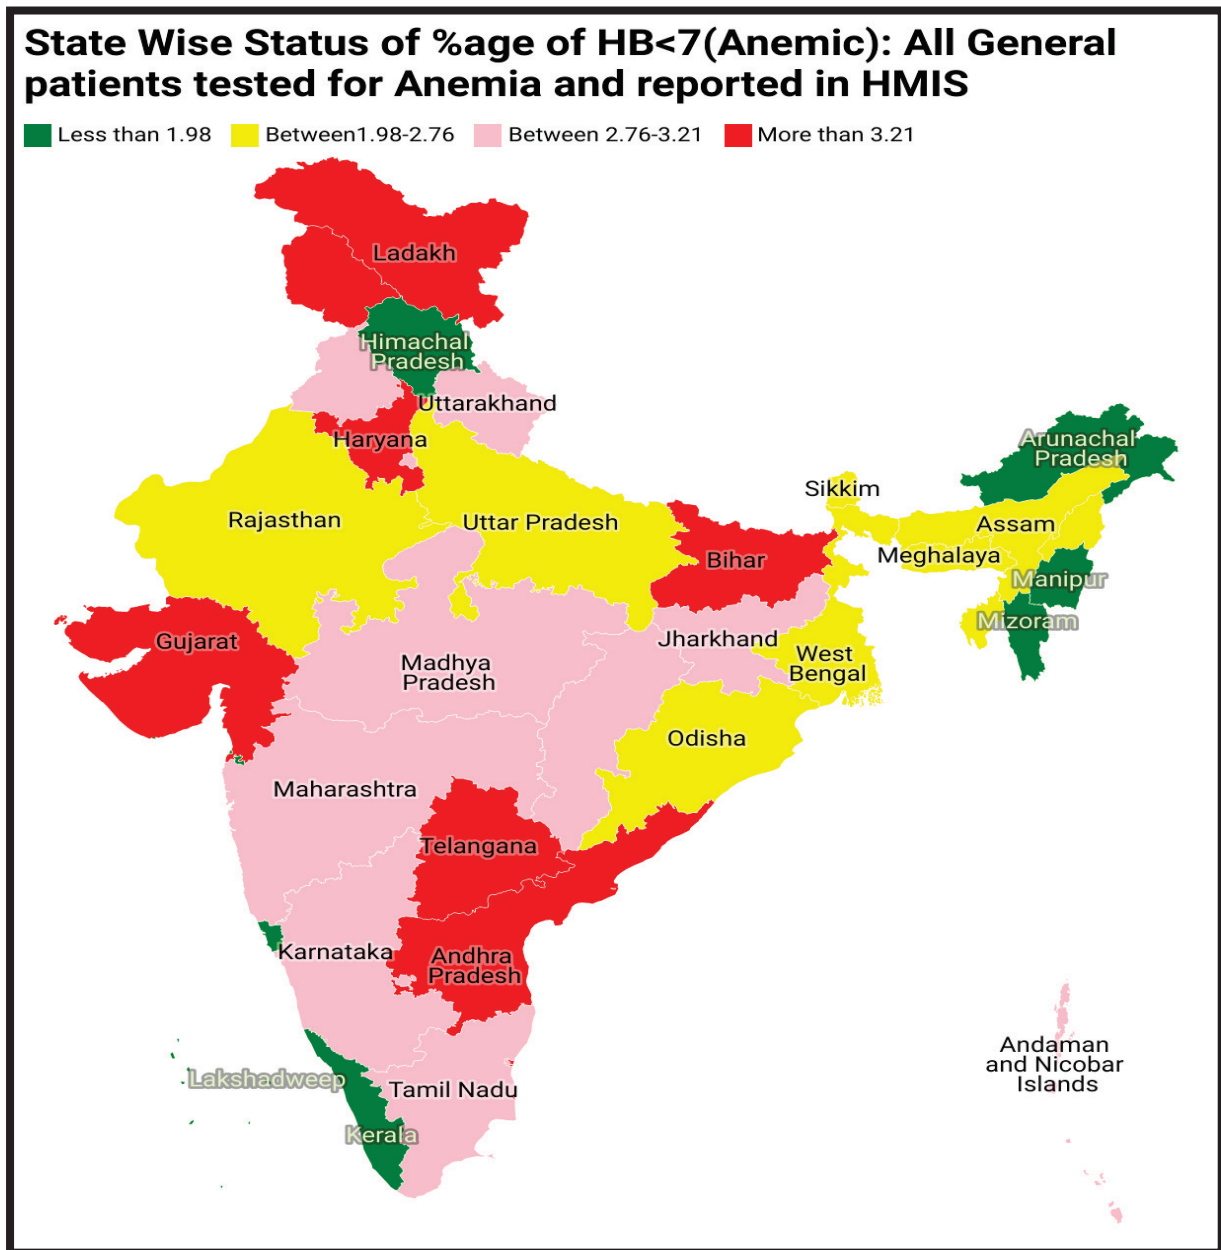

Figure 7.5 Percentage of tested cases having Hb<7 reported By State.

The above Map represent the State reported HB less than 7. The State(s) reported more than 3.21% of tested cases shows in color red represent i.e. high number of patients having anemia in comparisons to other State(s).

7.1.1.a Haemoglobin (Hb) testing For Pregnant Women:-

Hb investigation during pregnancy is important factor of ANC. Anemia during pregnancy is a health problem affecting nearly half of all pregnant women worldwide. High fetal demands for iron renders iron deficiency, which is the most common cause of anemia, with other micronutrient deficiencies contributing less frequently

Abnormally high Hb concentrations during pregnancy usually indicate poor plasma volume expansion, which also leads to risks for certain adverse pregnancy outcomes as

LBW along with premature births, stillbirths & Maternal Deaths. Early diagnosis may help in improving the haemoglobin levels well in time.

Based on the data reported by States/ UTs on HMIS during 2020-21 & 2021-22, 67.9% and 70% of pregnant women respectively were tested for Hb out of Total ANC i.e. 3% of increment in testing over the year. Out of this, not more than 5% of pregnant women diagnosed with severe anaemia. State/ UT-wise data is given in **Annexure 7.10**.

Figure 7.6 Pregnant Women Tested for Anaemia

Blood Sugar using OGTT Testing during pregnancy

Gestational diabetes is a type of diabetes that is first seen in a pregnant woman who did not have diabetes before she was pregnant. Some women have more than one pregnancy affected by gestational diabetes. Gestational diabetes usually shows up in the middle of pregnancy. Doctors most often test for it between 24 and 28 weeks of pregnancy. In such cases the blood glucose level (blood sugar) of the mother stays high (hyperglycemia) because she is unable to make and use all the insulin needed to support the demands of the pregnancy.

The OGTT (Oral Glucose Tolerance Test) is gold standard for diagnosis of Gestational Diabetes Milletus (GDM) is done between 24 and 28 weeks of pregnancy. If a pregnant woman had a history of gestational diabetes before, an OGTT is done at the time of registration and then another OGTT at 24 to 28 weeks if the first test is normal.

Based on the data reported on HMIS during 2021-22, 20.5% pregnant women were tested for Blood sugar using OGTT which is 5% higher as compare to 15% in FY 2020-21. State/ UT-wise details are given in **Annexure 7.2**.

Figure 7.7 Maternal Diabetes During Pregnancy.

In addition, at all India level out of those who were tested, 2.5% PW found Positive for gestational diabetes in FY 2021-22 which is less than as compare to 2.8% in FY 2020-21.

Figure 7.8 illustrates that Puducherry has reported the highest rate of PW found positive for Gestational diabetes in FY 2021-22 i.e. (18.9%) followed by Kerala (11.30%) and Lakshadweep (8.09%) which also shows that the rate was increased as compare to last year in these States. The reduction can also be seen in Andhra Pradesh and Madhya Pradesh in FY 2021-22 in comparison with 2020-21.

Figure 7.8 Prevalence of Gestational Diabetes for States/UTs which have surpassed the National Average

On the other hand, Uttarakhand has reported lowest rate (0.02%) of gestational diabetes followed by Tripura and Ladakh in FY 2021-22. Meanwhile, Assam and Bihar shows Major reduction in FY 2021-22 as compare to FY 2020-21.

Figure 7.9 Prevalence of Gestational Diabetes for States/UTs which have below the National Average.

7.1.2 HIV Testing:

HIV is a virus that affects the body's immune system. When it goes untreated, it can lead to AIDS (acquired immunodeficiency syndrome). HIV testing, also called HIV screening, is the only way to know if you have the virus present in the body. Antibody test checks for antibodies specific to HIV in your blood or oral fluid. In general, this test use blood from a vein which can detect HIV sooner after infection than tests done with blood from a finger prick or with oral fluid. The State/UTs details are given at **Annexure 7.6**.

Figure 7.10 Gender wise percentage of HIV tests.

Based on reported data, at National Level in FY 2020-21 highest test performed on ANC female (57.54%), lowest test performed on Non ANC female (18.96%) followed by Male (23.49%) Whereas, in FY 2021-22, lowest test performed was on males (25.25%) followed by Non ANC Female (20.90%) whereas ANC Female (53.85%) is the highest.

Figure 7.11 Percentage of Cases Tested Positive for HIV by Gender

At National level, in FY 2021-22, Out of total HIV test (392117560), 0.21% Males have tested positive for HIV, while 0.12% Non ANC Females have tested positive for HIV. In case of pregnant women 0.11% have tested positive for HIV which is lowest among them.

HIV in Pregnant Women:

Human immunodeficiency virus (HIV) is an infection with a global prevalence and currently has no cure or vaccine. Women living with HIV who become pregnant or who acquire the virus during pregnancy are at risk of both maternal and perinatal morbidity and mortality mainly if the virus is poorly controlled. Furthermore, there is a risk of vertical transmission to the fetus during pregnancy labour and postpartum through breastfeeding. Appropriate management must be instituted to reduce the consequences of HIV in pregnancy.

Figure 7.12 Annual reduction in positive cases relative to tested cases in pregnant women.

The above Figure shows that HIV prevalence among pregnant women is trending downward as the number of tests increases each year.

7.1.3 Syphilis testing:

Syphilis is a sexually transmitted disease (STD). Blood tests can reveal if the body is making the antibodies to fight the infection. Syphilis tests can help diagnose syphilis in the early stages of infection, when the disease is easiest to treat. Rapid Plasma Reagin (RPR), a syphilis blood test that looks for antibodies to the syphilis bacteria and Venereal Disease Research Laboratory (VDRL) test is used for testing Syphilis.

HMIS is capturing data for Male and female tested for syphilis. At National level 3.3% Males are found sero positive for Syphilis and 1.6% Non ANC Female in FY 2021-22, which has been declined as compared to FY 2020-21.

Figure 7.13 Male and Non-ANC Female tested and positive for Syphilis.

Syphilis Testing during pregnancy

Syphilis is a sexually transmitted infection caused by the spirochete bacterium *Treponema Pallidum*, subspecies *Pallidum* that may also be transmitted from mother to foetus during pregnancy or at birth resulting in congenital syphilis. It can seriously complicate pregnancy and result in spontaneous abortion and stillbirth.

Stillbirths and early childhood mortality due to syphilis are continually being reported each year. World Health Organization (WHO) estimated that up to 1.5 million cases of syphilis in pregnancy occurs each year. Timely diagnosis and proper management of the infection in the pregnant woman are important in order to prevent adverse outcome. Syphilis in pregnancy remains an important medical condition due to its consequences. Timely diagnosis and treatment of the disease is therefore very important. The State/ UT-wise details are given at **Annexure 7.9**.

Table 2. Sero-prevalence of pregnant women for syphilis

	Total no. of PW registered for ANC	No. of PW tested using POC test for Syphilis	No. of PW found sero Positive (Out of tested PW)	% of PW found sero positive for syphilis
2020-21	27591287	2476264	13522	0.55
2021-22	27642485	3517475	3792	0.11

Figure 7.14 Pregnant Women tested and found positive for Syphilis.

As per the data reported by States/UTs less than 1% Pregnant women were found to be sero positive for syphilis in FY 2020-21 and 2021-22.

7.1.4 Widal Tests

Widal Test (Slide Agglutination) test helps to detect typhoid fever and paratyphoid fever, collectively called enteric fever, which is caused by the consumption of food or water contaminated by Salmonella bacteria. These microorganisms, like Salmonella typhi and Salmonella paratyphi A, B, and C cause Typhoid fever or enteric fever, is an acute, life-threatening, fever-causing illness that is transmitted by the ingestion of food or water.

Figure 7.15 Percentage of Tested Positive for Widal By States / UT Reporting Above National Average.

During 2020-21 and 2021-22 at National Level, 52 Lakh and 90 Lakh Widal tests were conducted respectively, out of which, 6.3 lakh (2020-21) and 11.4 lakh (2021-22) were found positive, and the rate of positivity is 12.72 % at National Level for 2021-22. Manipur, Nagaland followed by Bihar has reported the highest positive Widal cases i.e. more than 25%. The State/ UT-wise details are given at **Annexure 7.5**.

Figure 7.16 Percentage of Tested Positive for Widal By States / UT Reporting below National Average.

The above graph shows that Lakshadweep reported the lowest value of 2%, a 5% decrease compared to the previous year.

7.1.5 Malaria Testing

Malaria is a disease having symptoms of recurrent fever with chill and headache. It is caused by parasites known as Plasmodium. It commences with the bite of female Anopheles mosquitoes which carries this parasite. Malaria can cause mild illness in some patients and life-threatening disease in others.

Microscopic examination: The most preferred and reliable diagnosis of malaria is microscopic examination of blood films as all of the four major parasite species can be

distinguished easily. Microscopy in both financial years shows that the positive rate of Plasmodium vivax test is higher than Plasmodium falciparum at all India level. The State/ UT-wise details are given at **Annexure 7.7**.

Figure 7.17 Percentage of Malaria positivity by species (Microscopy).

7.1.6 **Rapid Diagnostic Test (RDT) for Malaria**

This test uses finger-stick and a drop of venous blood. The reading can be assessed visually as the presence of colored strips on the dipstick. It takes a total of 15–20 minutes to complete the procedure. Data for both these tests are captured in HMIS. Figure 7.18 depicts Malaria positivity by RDT test having a higher positivity rate for Plasmodium falciparum than for Plasmodium vivax. The State/ UT-wise details are given at **Annexure 7.8**.

Figure 7.18 Malaria-positive rates by type using rapid diagnostic tests (RDTs).

Radiology: Radiology is a branch of medical Science, which deals with diagnostic application that uses imaging technology to diagnose and treat disease. Process is divided

into different procedures, each using a different test, which takes pictures of the body parts. Radiography includes tests such as X-ray, ultrasound etc.

3.9 Crore Radiology tests were conducted across the country during 2020-21 which comprised 73% X-Ray and 27% ultrasound. Whereas, in FY 2021-22, 5.8 Crore tests were conducted and X-ray, ultrasound test were increased by only 1%. The State/ UT-wise details are given at **Annexure 7.4**.

Figure 7.19 Percentage wise distribution of types of Radiological Examination.

The figure depicts that than more than 70% X-ray is being conducting in radiology and less than 30% examination of Ultrasound.

7.2 Lab Tests & OPD

OPDs provide all general services and facilities including Diagnostic services, which is an important and essential part of the OPD, where the tests done to proceed with treatment required for the patients who are visiting the health facility for OPD and inpatients.

At all India level during 2020-21, a total; of 113 crore outpatient (Allopathic and Ayush) consultations were done and 59 crore lab investigations were conducted which comes to 52.41%, similarly during 2021-22 a total of 143 crore Outpatient consultations were done and 89 crore lab investigation were conducted which is 61.19% (details in Annexure 7.1)

Figure 7.20 Percentage of Laboratory Investigations to the Total OPD by States -Reporting Above National Average.

19 States have reported higher than the National average of 62.19% such as Gujarat, Mizoram, Puducherry, Goa and Chandigarh are reporting more than 100% Lab tests as compared to outpatients.

Figure 7.21 Percentage of Laboratory Investigations to the Total OPD by States Reporting below National Average.

Among the States which have reported less than National average, Bihar has reported the least i.e. 16.38% followed by Arunachal Pradesh which is 29.07%, rest all have reported above 30% lab tests as compared to Outpatients.

7.3 Lab Tests & OPD + IPD

On the other hand, if Lab tests are compared with total patient-load of the facility i.e. both out-patient and in-patient, a similar trend is seen with more than 50% of the patients (both out-patient and in-patient), have received lab services during 2020-21 and 2021-22.

Figure 7.22 Patient load vs laboratory investigations.

CHAPTER 8

FIRST REFERRAL UNITS

What is a First Referral Unit (FRU)?

Healthcare delivery in India has been envisaged at three levels namely Primary, Secondary and Tertiary. The secondary level of health care essentially includes Community Health Centres (CHCs), constituting the First Referral Units (FRUs) and the Sub-district and District Hospitals. The CHCs were designed to provide referral health care for cases from the Primary Health Centres level and for cases in need of specialist care approaching the Centre directly.

Figure 8.1 Tiered structure of Public Health Facilities in India

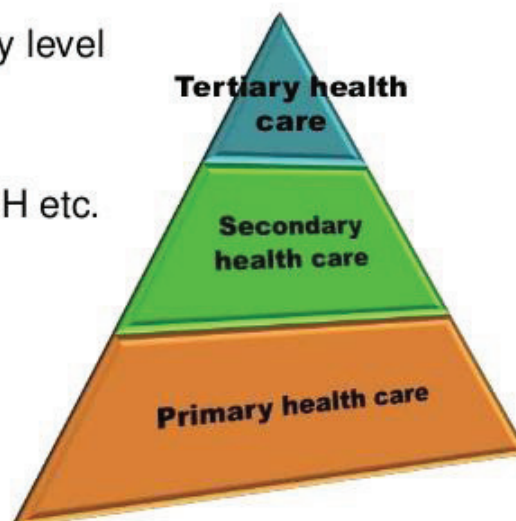

Levels of health care

- Primary Health care**
 - Provided at the community level

- Secondary health care**
 - Provided at PHC, CHC, DH etc.

- Tertiary health care**
 - Provided at hospitals

A CHC is a 30-bedded hospital providing specialist care in Medicine, Obstetrics and Gynaecology, Surgery, Paediatrics, Dental and AYUSH. These centres are however fulfilling the tasks entrusted to them only to a limited extent.

First Referral Units (FRU) provides comprehensive obstetric care services including like cesarean section, newborn care, emergency care of sick children, full range of family planning services, safe abortion services treatment of STI/RTI availability of blood storage unit and referral transport services. Number of FRUs has increased significantly from 940 in 2005 to 1685 Functional FRUs in 2021-22.

Background:

Reduction in Maternal Mortality rate is the stated goal for National Population Policy, National Health Policy and Tenth Five Year Plan and is also one of the Millennium Development Goals (MDG) to which the country is a signatory and has to respond. The Maternal mortality in India continues to remain unacceptably high. Historical evidence at the global level has demonstrated that it is possible to bring down maternal mortality effectively if a package of obstetric services is provided within reach of the communities and the families. It is in this context that efforts were initiated in 1992 with the implementation of the Child Survival and Safe Motherhood (CSSM) Programme with assistance from World Bank and UNICEF for upgrading the existing community health centers and sub-district hospitals into First Referral Units (FRUs), to be equipped for providing delivery of emergency obstetric care to pregnant women with complications.

Over the years, a number of steps have been taken under the RCH Programme for facilitating the operationalisation of these FRUs. These have included funds for operationalising Operation Theatre (OTs) and Labour Rooms (LRs), supply of equipment kits, supply of drug kits containing emergency obstetric care drugs and funds for hiring of Anaesthetists from private sector. Drugs and Cosmetics Rules have also been amended to enable setting up of Blood Storage Units in the institutions designated as First Referral Units (FRUs).

The Maternal Mortality Rate (MMR) at the National level continues to be above 178 per 100,000 live births. The MMR in many major states particularly those, which are part of the Empowered Action Group (EAG), is much above the National average. This situation is a major cause of concern and it is imperative that focused efforts have to be made for making the First Referral Units fully operational, in case we have to meet the National objective of bringing down the MMR to less than 100.

An existing facility i.e. district hospital, sub-divisional hospital, Community Health Centre etc. can be declared fully operational First Referral Unit (FRU) only if it is equipped to provide round the clock services for Emergency Obstetric and New Born Care, in addition to all emergencies that any hospital is required to provide.

Designated FRUs in India (as marked in HMIS)

HMIS has a provision for marking a facility as First Referral Unit (FRU) in the facility master. As per the marking of facilities as FRU in the HMIS Facility Master, at All India level during 2020-21 3376 facilities have been marked as First Referral Unit, whereas during 2021-22 the number has increased to 3559.

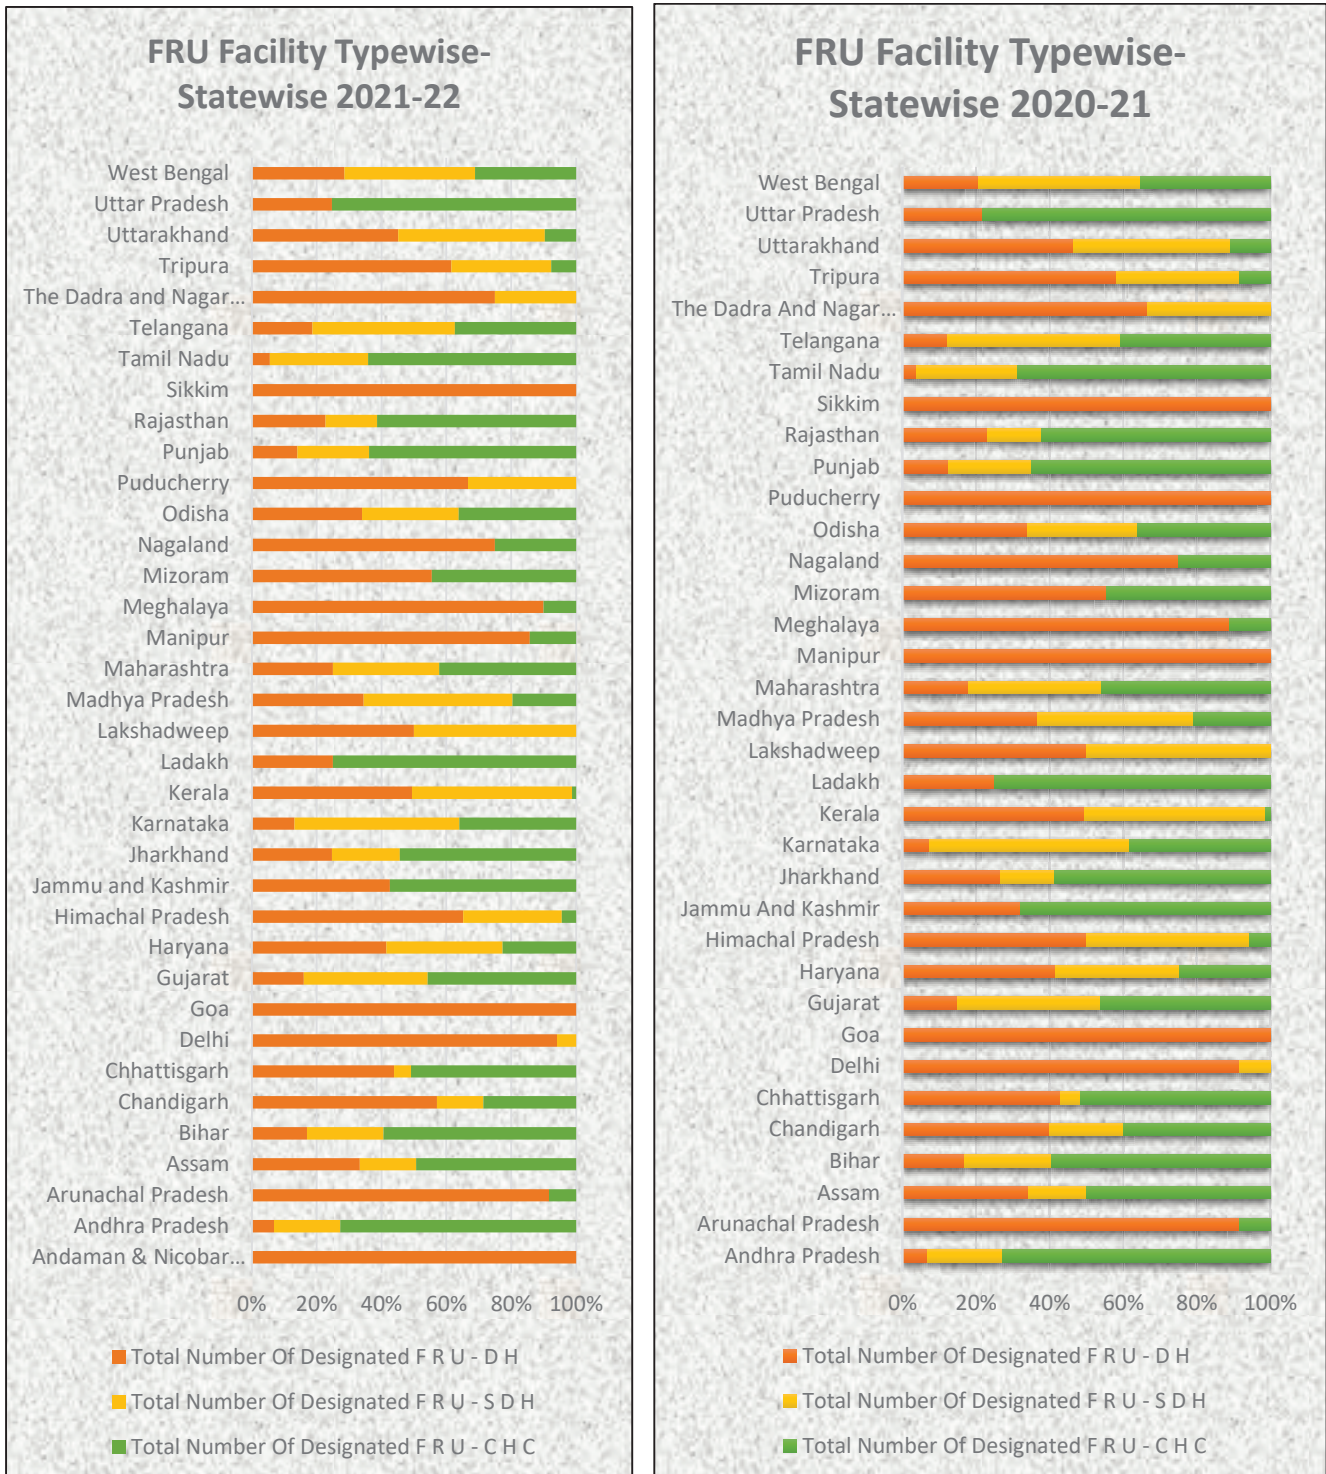

It can be seen that the share of District Hospitals and Sub District Hospitals marked as FRU have increased during 2021-22 from 677 in 2020-21 to 807 in 2021-22 and for SDH the number has increased from 891 in 2020-21 to 944 in 2021-22.

Fig 8.2: Number of designated FRU Facility type wise:

State wise facility type wise breakup of FRU reveals that in 4 States/ UTs i.e. Goa, Manipur, Puducherry, Sikkim all the FRU facilities are at District Hospital level only but no lower level facility has been marked as FRU during the year 2020-21. Whereas during the year 2021-22 only two States/ UT i.e Goa and A&N Islands have all FRU facilities at DH only. The State wise FRUs with bifurcation of Facility types as follows:

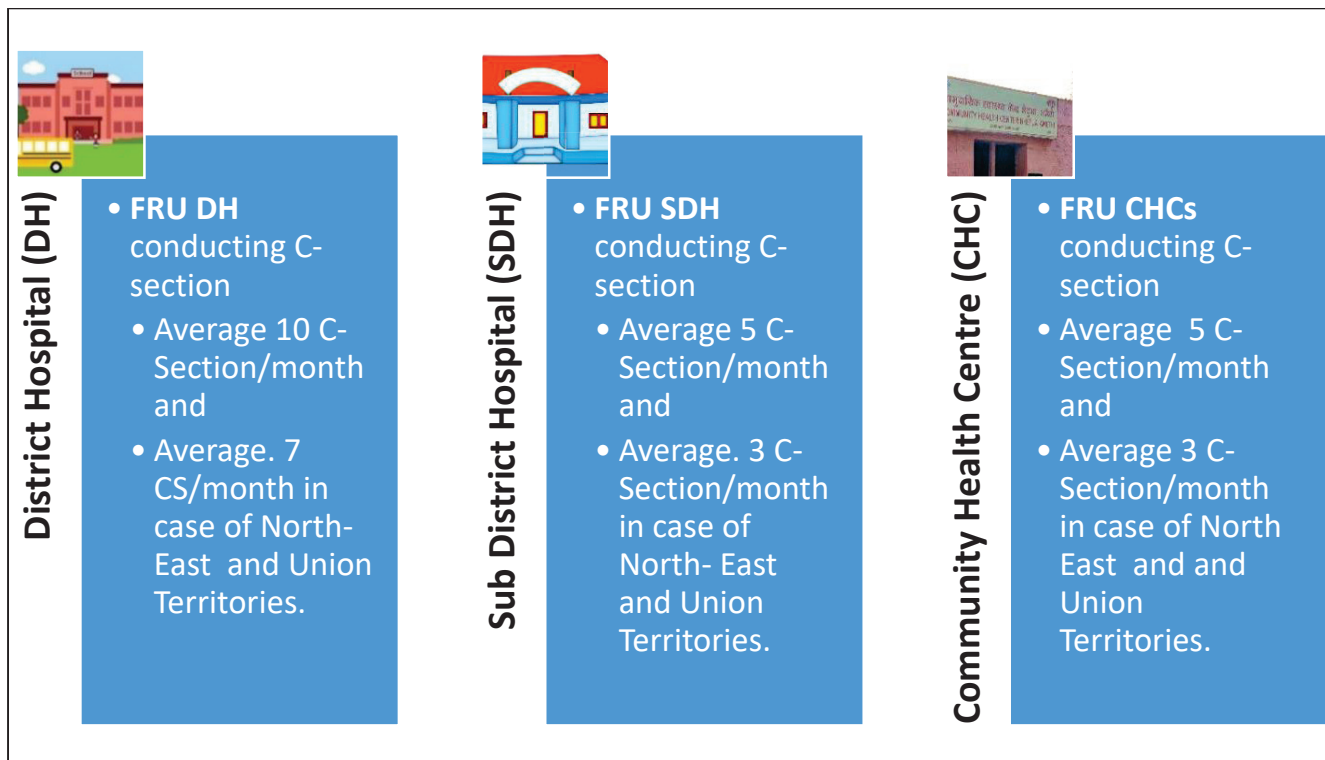

Figure 8.3 Number of FRU Facility Typewise - Statewise

Criteria for facilities to be categorized as Functional FRU

The basic criterion for a facility which has been marked in HMIS Facility Master as FRU to be classified as functional FRU is as follows:

Figure 8.4 Criteria for being a functional FRU

Outcomes based on functionality criteria

Based on the above mentioned criterion for being a functional FRU as above during 2021-22, 85% of District Hospitals i.e. 689 out of 807 satisfy the criteria; 64 % Sub District Hospitals i.e. 602 out of 944, whereas only 22% of CHC i.e. 394 out of 1808 satisfy the criteria.

Figure 8.5 Number of designated vs. conditional FRU Facility Typewise

Figure 8.6 Percentage of Facilities Satisfying the Criteria of FRU 2021-22

If we see the state-wise data of Facilities satisfying the criteria of Functional FRU, 100% of facilities in A& N Islands, Chandigarh, Goa, Lakshadweep and Sikkim are satisfying the criteria i.e. all the facilities marked as FRU in HMIS facility master are functioning as FRUs, whereas for Mizoram only 11% and for Bihar only 16% facilities are functioning as FRU. The State/UT-wise details are given at **Annexure 8.3 & 8.4**.

Figure 8.7 Percentage of Facilities Satisfying FRU criteria (2021-22) State wise

First Referral Units (on the basis of population)

As per population norms one First Referral Unit (FRU) should be there for every 5 lac population. As per this norm there should be around 2714 FRU across the country, whereas in HMIS 3559 facilities have been marked as FRU in 2021-22 which is 24% more than the

norms at All India Level while during the previous year i.e. 2020-21 in HMIS 3380 facilities have been marked as FRU against a requirement of 2714 FRUs which is 25% more than the norms at All India Level. The State/ UT-wise details are given at **Annexure 8.1 & 8.2.**

CHAPTER 9

PATIENT SERVICES UTILIZATION

9.1 OUTPATIENT DEPARTMENT

The vision of the NHM is the “Attainment of Universal Access to Equitable, Affordable, and Quality health care services, accountable and responsive to people’s needs, with effective inter-sectoral convergent action to address the wider social determinants of health”. NHM focuses on decentralized health planning, service delivery, creating knowledge hubs within district hospitals, strengthening secondary level care at district hospitals, expanding outreach services, improving community processes and behaviour change communication, human resources development, public health management, and Health Management Information System (HMIS).

Out Patient Department (OPD) services plays an important role in measurement and availability of the various key health services at facility level. After the implementation of Ayushman Bharat-Health and Wellness Centres, the range of OPD services has been extended even upto Sub Centre level.

In HMIS, the data of OPD services is captured in the form of Outpatients for Diabetes, Hypertension, Stroke (Paralysis), Acute Heart Diseases, Mental Illness, Epilepsy, Ophthalmic, Dental, and Oncology etc. at the Primary, Secondary and Tertiary levels.

Figure 9.1 Year wise comparison of total OPDs

The data reported by the States/ UTs in HMIS portal has been analyzed for the year 2020-21 and 2021-22 with respect to the total OPD cases and individual contribution of the different facility level has been observed. It is noted that during the year 2020-21 at National Level SCs, PHCs, CHCs, SDHs & DHs caters to 16.4%, 34.7%, 19.5%, 14.4% and 15% of total OPDs respectively, whereas almost the same trend has been observed for the year 2021-22 as 16.7%, 31.9%, 19.4%, 15.6% and 16.3% of OPDs respectively. However, at PHC and SDH level there is decline of 2.8% and 1% of OPD cases, whereas at DH there is 1% increase in the year 2021-22 w.r.t 2020-21. The State/ UT wise OPD services provided by each facility type during year 2020-21 and 2021-22 are represented under **Figure 9.1a & Figure 9.1b** respectively.

Figure 9.1a Percentage of OPD catered as per facility type (2020-21)

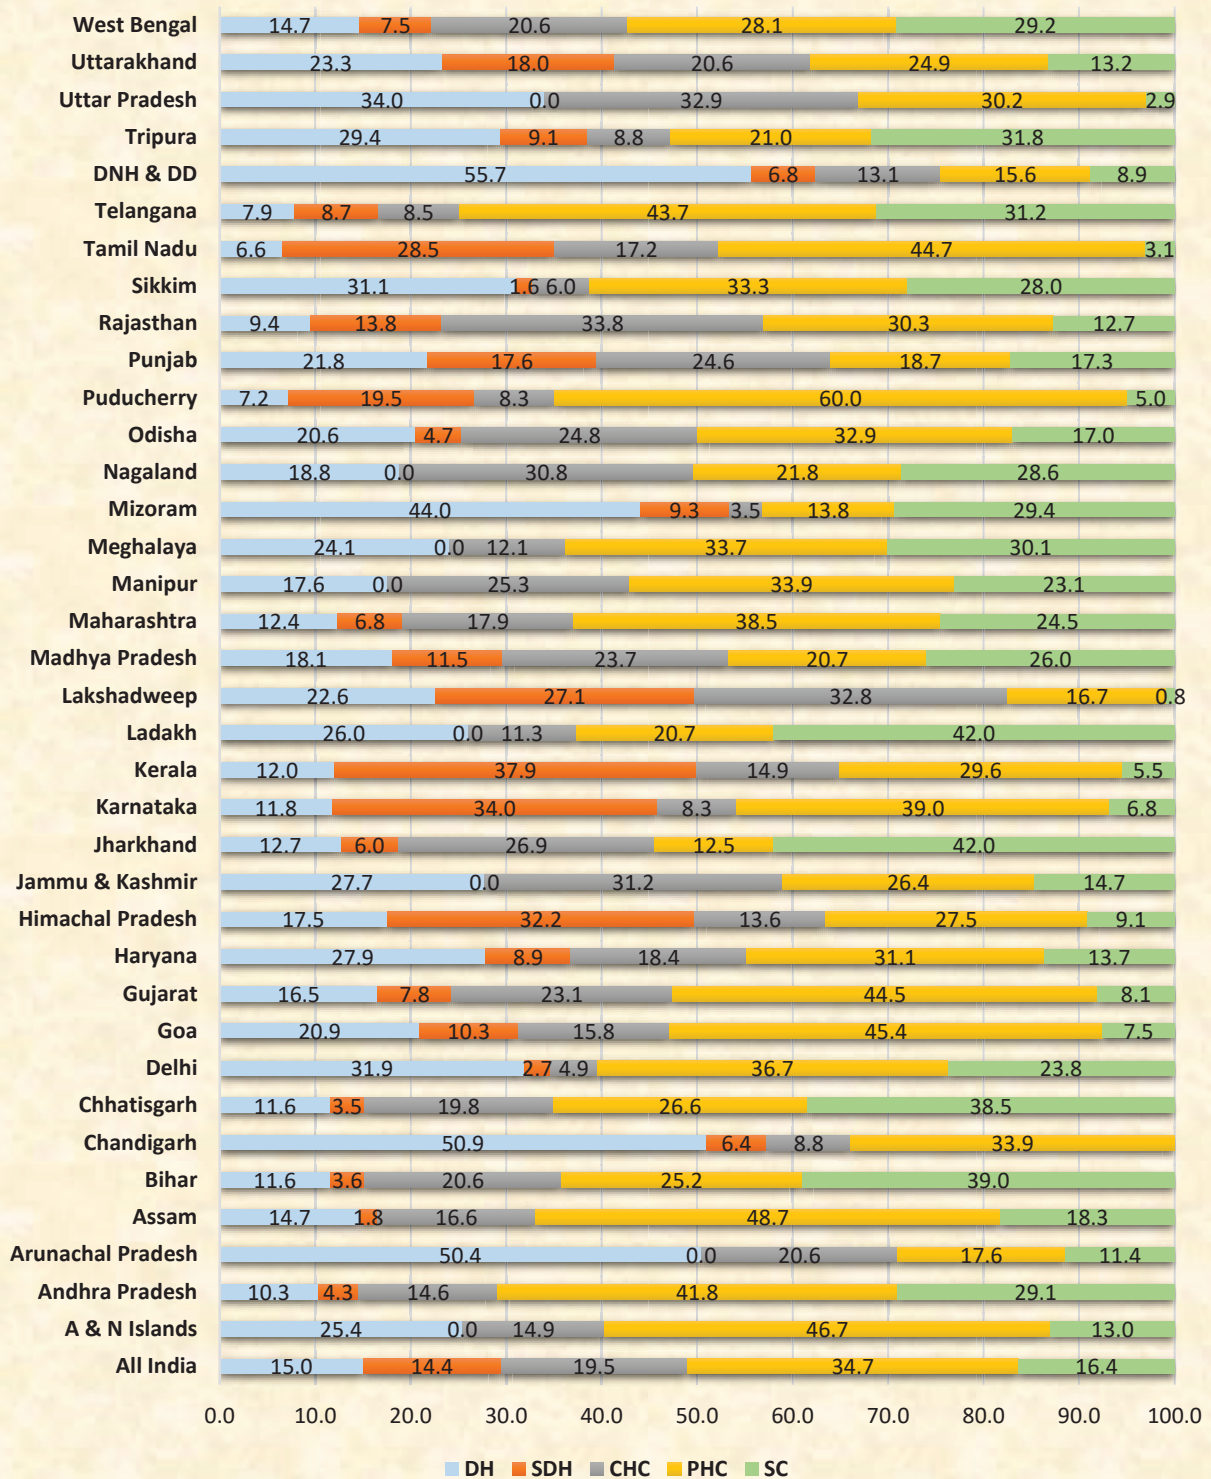

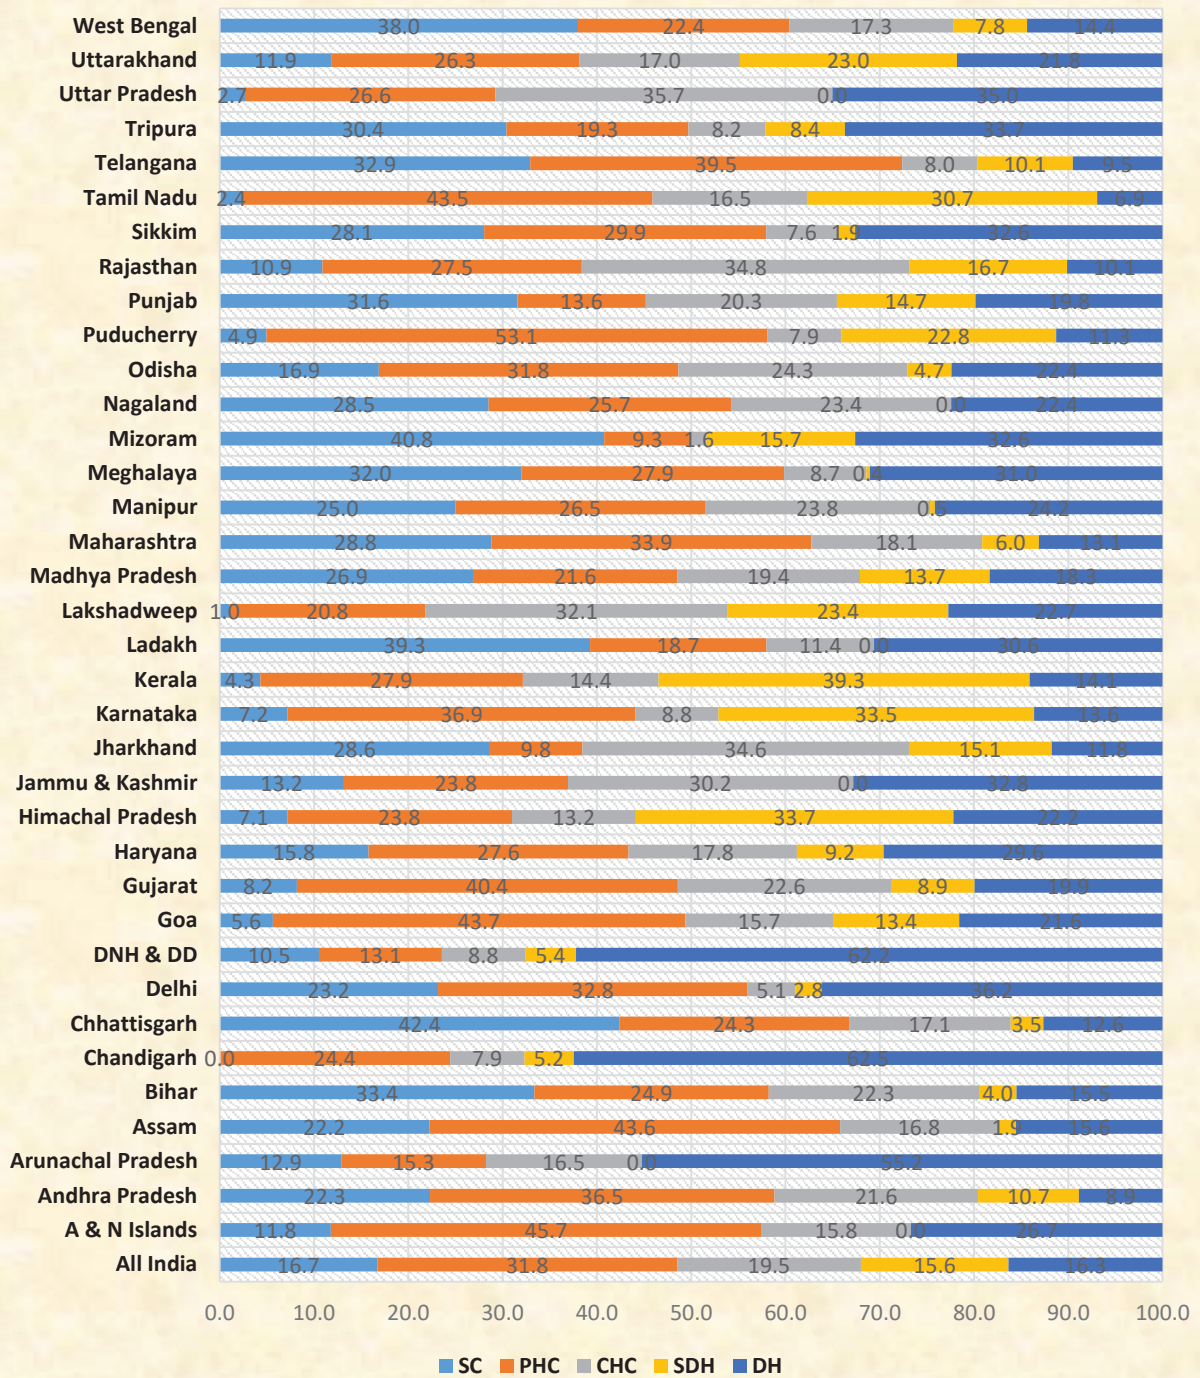

Figure 9.1b Percentage of OPD Catered as per facility type (2021-22)

Top 5 States/ UTs contributing to the highest percentage of OPD to Total OPD- facility wise in FY 2020-21 and 2021-22 (Table 9.1 & Table 9.2):

Table 9.1

	2021-22	2021-22	2021-22	2021-22	2021-22
1	Chhattisgarh (42.4%)	Puducherry (53.1%)	Uttar Pradesh (35.7%)	Kerala (39.3%)	Chandigarh (62.5%)
2	Mizoram (40.8%)	A & N Islands (45.7%)	Rajasthan (34.8%)	Himachal Pradesh (33.7%)	DNH & DD (62.2%)
3	Ladakh (39.3%)	Tamil Nadu (43.7%)	Jharkhand (34.6%)	Karnataka (33.5%)	Arunachal Pradesh (55.2%)
4	West Bengal (38%)	Goa (43.6%)	Lakshadweep (32.1%)	Tamil Nadu (30.7%)	Delhi (36.2%)
5	Bihar (33.4%)	Assam (43.5%)	Jammu & Kashmir (30.2%)	Lakshadweep (23.4%)	Uttar Pradesh (35%)

9.2 OPD Services per Doctor per year at Public Health Facilities (excluding medical college)

HMIS data for the OPD cases (Allopathic + AYUSH) and the number of doctors reported against the health facilities for the year 2020-21 and 2021-22 has been analyzed at each facility level to get the inference about the number of OPD cases catered by per doctor per year. The State/ UT-wise number of OPD cases per doctor per year at PHCs, CHCs, SDH & DHs for the year 2020-21 and 2021-22 is represented under **Annexure 9.1**

9.2 a. Primary Health Centres (PHCs): PHC is the first physical point of contact between Patient and the Doctor, therefore OPD services play important role towards the preliminary diagnosis as well the further referral to the higher level of health facilities, wherever required.

9.2 b. Community Health Centres (CHCs): CHCs caters to essential services including preventive, promotive, curative, palliative, rehabilitative services along with the mandate to provide specialized care which is offered through specialists (physicians, surgeons, obstetricians, pediatricians, and anesthesiologists etc.).

9.2 c. Sub District/ Divisional Hospital (SDH): SDH have a mandate to provide secondary care services and acts as Referral Units for the Tehsil/Taluk/Block population in which they are geographically located and SDHs are below the district and above the block level (CHC) hospitals. SDHs form an important link between SCs, PHCs and CHCs on one end and District Hospitals on the other end. They also save travel time for cases needing emergency care and reduce the workload of the district hospitals.

States/ UTs like A & N Islands, Arunachal Pradesh, Jammu & Kashmir, Ladakh, Nagaland and Uttar Pradesh have no serving SDHs. For Meghalaya there was no facility mapped under SDH during 2020-21, whereas during 2021-22 there are two facilities mapped as SDH. Also, one SDH under Manipur has not reported any OPDs during 2020-21.

9.2 d. District Hospital (DH):

As per the defined guidelines every DH should comprehensively function for providing secondary care services along with the critical care services like Emergency, High Dependency Unit (HDU)/Intensive Care Unit (ICU), Operation Theatre (OT), Labour Delivery, Special Newborn Care Unit (SNCU), lab and diagnostic services etc. District Hospital has specialist OPD services in order to cater for the specific need of the population for the respective district.

9.2 e. State/ UT wise analysis at PHC, CHC, SDH and DH level for the year 2020-21 and 2021-22 are as follows:

Year	Average OPD at All India level				Range of OPD cases per doctor per year across the States/ UTs				No. of States/ UTs with lesser OPD than the National average				No. of States/ UTs with more OPD than the National average			
	PHC	CHC	SDH	DH	PHC	CHC	SDH	DH	PHC	CHC	SDH	DH	PHC	CHC	SDH	DH
2020-21	8765	7112	6913	4584	716 – 21537	502 – 17178	145 – 11749	516 – 28410	23	24	20	24	13	12	8	12
2021-22	9973	8474	9176	5832	723 – 27170	603 – 23431	319 – 21221	897 – 10462	24	24	21	28	12	12	7	8

9.2 f. Top five States catering to the maximum OPD per doctor per year for each level of public health facilities during 2020-21 and 2021-22:

For the year 2020-21, Tamil Nadu has contributed in all four categories, Kerala and Rajasthan have contributed in three categories, whereas Madhya Pradesh and Puducherry have contributed in two categories of health facilities among the top performer States with respect to OPD cases per doctor per year. Whereas for the year 2021-22, Tamil Nadu and Kerala contributed in all four categories and Rajasthan & Puducherry contributed in three & two categories respectively.

The States/ UTs highlighted in specific colors representing in particular health facility category may be referred in Table 9.3 (2020-21) and Table 9.4 (2021-22).

Table 9.3

Primary Health Centre	Community Health Centre	Sub District Hospital	District Hospital
Tamil Nadu	Kerala	Tamil Nadu	A & N Islands
Puducherry	Puducherry	Kerala	Tamil Nadu
Telangana	Rajasthan	Karnataka	Haryana
Kerala	Tamil Nadu	Rajasthan	Rajasthan
West Bengal	Madhya Pradesh	Madhya Pradesh	Uttar Pradesh

Table 9.4

Primary Health Centre	Community Health Centre	Sub District Hospital	District Hospital
Tamil Nadu	Kerala	Tamil Nadu	Tamil Nadu
Puducherry	Puducherry	Kerala	Uttar Pradesh
Kerala	Andhra Pradesh	Rajasthan	Kerala
Delhi	Rajasthan	Madhya Pradesh	Rajasthan
Telangana	Tamil Nadu	Karnataka	Haryana

9.3 LAB TESTS

Lab Investigations plays important role in the healthcare system which help the service providers to make decisions about care provision related to the prevention, screening, detection, diagnosis and treatment or management of the illness at primary, secondary and tertiary level of health facilities. The facility of the Lab investigations is available from the level of PHCs to DHs, as the functional Laboratory is available along with the required HR and Infrastructure. However, at the level of SC few lab tests are available which does not require an equipped lab and can be performed by HW (F) or HW (M). The facilities for certain important lab tests is available round the clock in the SDH & DH which provides the emergency services.

Under HMIS the various Lab investigations like Hb tests conducted, HIV Tests for male and female (ANC & non-ANC), STI/RTI attendees tested for syphilis, Widal tests, X-ray, USG etc. are being captured depending upon the level of the health facility. The comparison of total Lab Tests conducted during 2019-20, 2020-21 and 2021-22 may be seen in **Figure 9.2**, which clearly gives inference that the decrease in number of lab tests during the year 2020-21 is due to the covid-19 pandemic.

The current analysis has been done based on the number of Lab tests done during the year 2020-21 and 2021-22. It is noted that during the year 2020-21 at National Level PHCs, CHCs, SDHs & DHs caters to total Lab Tests of 13.5%, 15.3%, 26.5% and 44.7% respectively, whereas almost the same trends have been observed for the year 2021-22 as 12.3%, 15%, 27.7% and 45% of Lab Tests respectively. At the PHC level there is the decline of 1.2% in Lab Tests, whereas at SDH there is 1.2% increase in the year 2021-22 w.r.t 2020-21. The State/ UT wise Lab tests done by each facility type during the years 2020-21 and 2021-22 are represented under **Figure 9.2a & Figure 9.2b** respectively.

Figure 9.2a Percentage Of Lab Tests Conducted As Per Facility Type(2020-21)

Figure 9.2 b Percentage Of Lab Tests Conducted As Per Facility Type (2021-22)

Top 5 States/ UTs contributing to the highest percentage of Lab Tests to Total Lab Tests performed - facility wise in FY 2020-21 (Table 9.5) and 2021-22 (Table 9.6):

Table 9.5:

S No.	PHC	CHC	SDH	DH
	2020-21	2020-21	2021-22	2021-22
1	Gujarat (32.4%)	Nagaland (64.6%)	Puducherry (82.8%)	Chandigarh (91.1%)
2	Andhra Pradesh (29.6%)	Manipur (64.3%)	Tamil Nadu (59.8%)	Delhi (83.5%)
3	Telangana (21.4%)	Jharkhand (63.1%)	Himachal Pradesh (51.2%)	Uttar Pradesh (81.6%)
4	Sikkim (21.2%)	Bihar (33.5%)	Kerala (50%)	DNH & DD (80.4%)
5	Karnataka (20.4%)	Rajasthan (31.8%)	Rajasthan (36.9%)	Mizoram (79.9%)

Table 9.6:

9.4 Lab Tests per Lab Technician at Public Health Facilities (excluding medical college)

HMIS data for 2020-21 and 2021-22 have been analyzed for the lab tests performed at each facility level to get the inference about the number of Lab tests catered by per Lab Technician (LT) per year.

State/ UT-wise analysis at PHC, CHC, SDH and DH levels for the year 2020-21 and 2021-22 are as follows:

Year	Average Lab Tests at All India level				Range of Lab Tests per LT per year across the States/ UTs				No. of States/ UTs with lesser Lab Tests than the National average				No. of States/ UTs with more Lab Tests than the National average			
	PHC	CHC	SDH	DH	PHC	CHC	SDH	DH	PHC	CHC	SDH	DH	PHC	CHC	SDH	DH
2020-21	4401	443	28009	27921	304 – 10982	443 – 42753	1104 – 80471	1255 – 94878	24	24	20	26	12	12	8	10
2021-22	5876	12743	37645	40602	286 - 13702	577 - 76887	703 - 98294	1519 - 118309	24	24	20	26	12	12	8	10

9.5 Top five States catering to the maximum Lab Tests per Lab Technician per year at a different level of public health facilities during 2020-21 and 2021-22:

For the year 2020-21, Tamil Nadu, Gujarat & Delhi has contributed in three categories, whereas Kerala, Chandigarh & Telangana has contributed in two categories of health facilities among the top performer States with respect to Lab Tests per Lab Technician per year. For the year 2021-22, Tamil Nadu, Gujarat & Delhi has contributed in three categories, whereas Rajasthan & Chandigarh has contributed in two categories respectively.

The States/ UTs highlighted in specific colors representing in particular health facility category may be referred in Table 9.7 (2020-21) and Table 9.8 (2021-22).

Table 9.7

Primary Health Centre	Community Health Centre	Sub District Hospital	District Hospital

CHAPTER -10

AN ANALYSIS OF HMIS DATA ON DISTRICT HOSPITALS

Background

The delivery of services through the public health sector in India follows a three tier structure of primary, secondary, and tertiary care services which covers both rural and urban areas of the country. Health system inputs (infrastructure, health workers, drugs, equipment, health information system and finances) are combined to provide quality health services that are equitable, accessible, affordable and responsive to the needs of the population.

District Hospitals come under the secondary health care services which are responsible for providing comprehensive health care services in a defined geographical area containing a defined population. The facility should provide a set of Essential (Minimum Assured Services) and Desirable services such as New-born services, Pshycharitic services, Physical Medicine and Rehabilitation services, Accident and Trauma services, Dialysis services, Anti-retroviral therapy and Patient Safety and Infection control.

The services of District hospital have three pillars: clinical care, a knowledge hub for

capacity development of HR in health and public health programme to ensure the continuum of care and reduce the disease burden.

- Clinical Care: includes curative, palliative and rehabilitative services along with services for implementation of national programmes, provision of drugs, administrative services and other support services. The services to be provided at different facilities are identified as 'Essential' and 'Desirable'.
 - Essential services -includes those '*minimum assured services*' that every facility at that level must provide.
 - Desirable services are those that a facility should aspire to ultimately achieve (if not already being provided) over a period of time in a phased manner.
- Knowledge hub: providing services like medical courses including Diplomate of National Board, nursing schools, ANM training and a resource centre equipped with computers, information resources and telemedicine capability.
- Continuum of Care: To ensure continuum of care, assured referral with facility readiness to manage referred cases must be established.

Key elements of district hospitals:

1. Affordability-Provide effective, affordable health care services (curative including specialist services, preventive, and promotive) for a defined population
2. Accessibility- At least one district hospital for every district providing advanced secondary care and certain critical care services like emergency, High dependency unit (HDU), special New-born care unit (SNCU), lab and imaging services, etc. need to be prioritised.
3. Extensive coverage- Service coverage encompassing both urban (district headquarter town) and the rural population in the district.
4. Broad scope- Provide wide-ranging technical and administrative support and education and training for primary health care.

Importance of District Hospitals:

When any patient reaches any nearby district hospital, they expect the following services from the District hospitals

OPD	Pharmacy	Diagnostics	IPD	Surgery	Intensive Care
<ul style="list-style-type: none"> • They expect a doctor in the required medical specialty in the outpatient department (OPD) to diagnose and treat their health disorder and prescribe tests and medicines, 	<ul style="list-style-type: none"> • The medicines prescribed by the doctor can then be obtained at the pharmacy in the hospital. 	<ul style="list-style-type: none"> • If the doctor orders diagnostic tests, the patient can get them done at a laboratory by a technician at that particular point of care. 	<ul style="list-style-type: none"> • If the doctor recommends admission, the patient can get a bed at the hospital.. 	<ul style="list-style-type: none"> • If a higher-level medical intervention, such as surgery, is suggested, the patient can be operated upon within a reasonable period of time. 	<ul style="list-style-type: none"> • During the patient's stay at the hospital, they are cared by the on-duty nurses. After the surgery, the patient should recover without any infection

The unavailability and inaccessibility of these health care services at public hospitals adversely impact the health outcomes and overall reputation of public hospitals in the country. So, it is important to conduct preliminary evaluation for the performance of all district hospitals at a regular interval of time in order to improve the health care delivery system. Undertaking such an exercise at a regular time period will help foster a sense of healthy competition between the individual district hospitals and provide them an opportunity to showcase progress against relevant indicators.

For monitoring the progress of health facility, Government of India has developed a web based portal named Health Management Information System (HMIS) which captures facility wise data related to service delivery and infrastructure. In service delivery Reproductive, Maternal and Child Health related, Immunisation family planning, Vector borne disease, Tuberculosis, Morbidity and Mortality, OPD, IPD Services, Surgeries etc. data are captured on monthly basis whereas in infrastructure, Manpower, Equipment, Cleanliness, Building, Availability of Medical Services such as Surgery, Super Specialties services, Diagnostics, Para Medical and Clinical Services data are captured on annual basis.

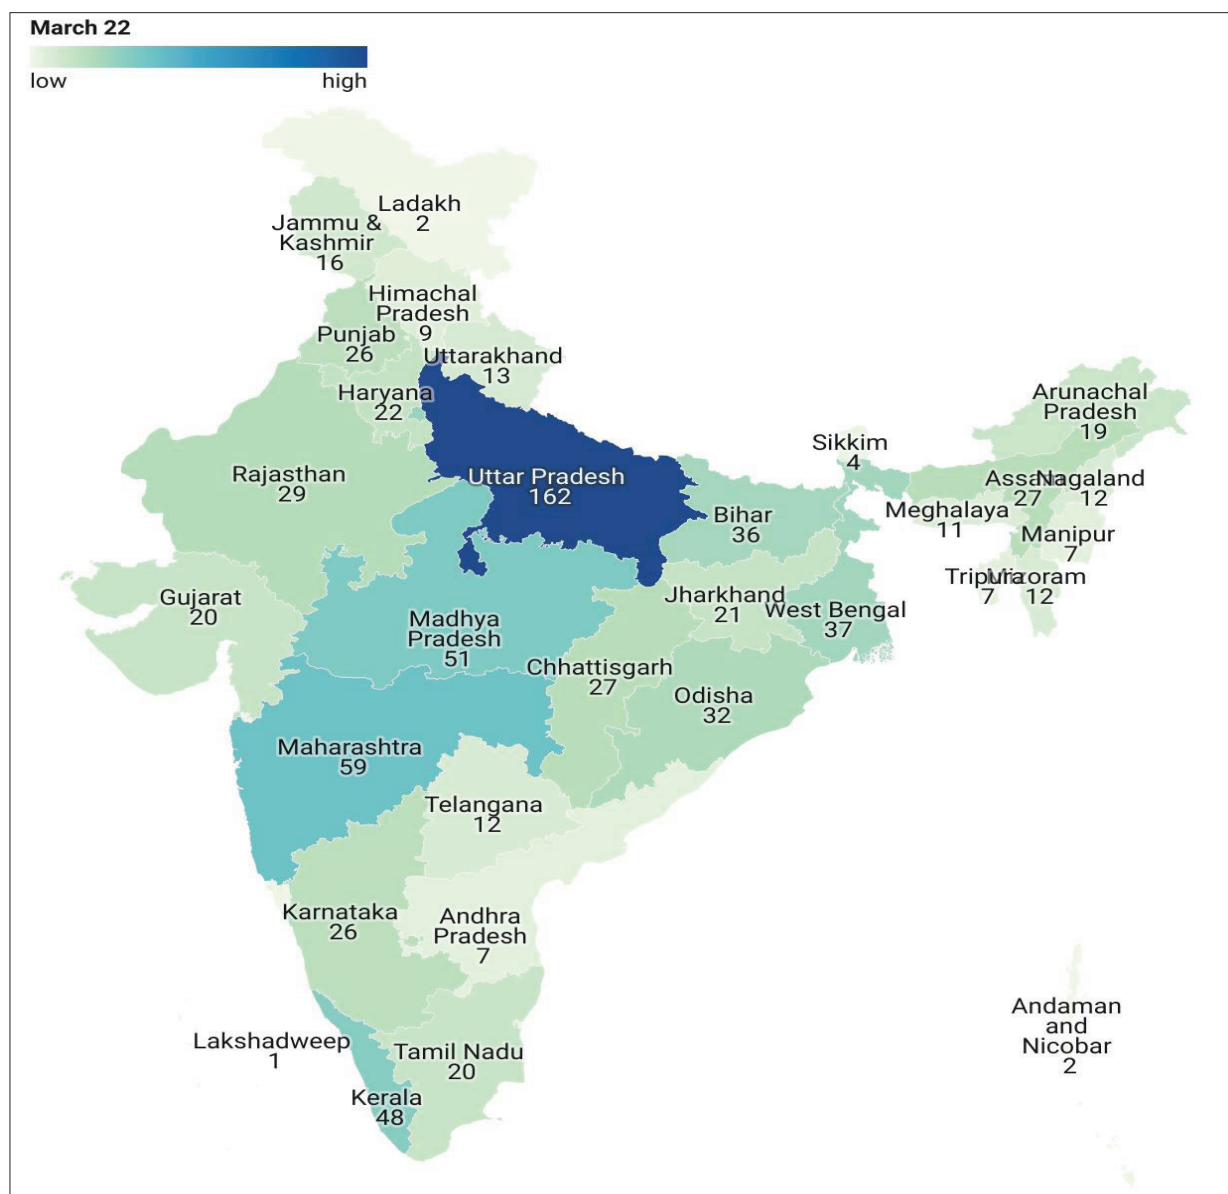

In this chapter, a comparative analysis of few indicators of government district hospital (except Medical colleges) has been done for two consecutive financial years 2020-21 and 2021-22. The indicators are: Average functional bed occupancy rate, Bed occupancy rate, C-section rate, Rate of initiation of breastfeeding, Blood replacement rate and Post- surgical site infection. The data reported on the HMIS portal was taken as a source of comparative analysis, and the data of district hospital in the financial year 2020-21 was taken as a base to compare the states performance with 2021-22 performance. In this analysis, medical colleges are excluded in the list of district hospitals.

The details of Districts Hospitals are shown below:

I. Number of district hospitals in the country

In the financial year 2020-21, there were overall 818 (excluding medical colleges) district hospitals in the country, which rose to 827 (excluding medical colleges) in the financial year 2021-22. The below map represents the number of district hospitals present in the each state of the country in the financial year 2021-22.

Figure 10.1 Number of District hospitals as on 31st March 22

II. Distribution of District hospitals based on the bed strength

National Health Policy, 2017 recommends two beds per 1000 population. It is therefore proposed that the provision of one bed per 1000 population is an 'Essential' norm for every district while two beds per 1000 is a target they should aspire towards 'Desirable'.

The 'Essential' number of beds in a district should be provided through the public health system of tertiary care (Medical Colleges), secondary care (DH, SDH and selected CHCs) and primary care (PHCs and remaining CHCs). 'Desirable' number of beds, the contribution of the private sector (based on the access to private health care in the local area), Railways, Armed Forces, Power Grid, Coal fields, Employees' State Insurance (ESI) and other Public Sector Undertaking (PSU) hospitals may also

be considered while continuing to strengthen and increase bed provision at public health facilities.

In 2022, Indian Public Health standards have developed guidelines to strengthen the essential and desirable beds based on the size of population served by the district hospitals. These guidelines are helpful as it provides a systematic basis for identifying resources required at the DH according to the size of the facility. Depending upon the bed occupancy and local health needs, states can propose more beds to achieve IPHS norms. The norms for bed strength are as follows:

Population	Essential beds	Desirable beds
Less than 2 lakh	50 beds+15 additional (Emergency and day care beds)	100
Between 2-5 lakh	100 beds+25 additional (Emergency and day care beds)	200
Between 5-10 lakh	200 beds+38 additional (Emergency and day care beds)	300
Between 10-20 lakh	300 beds+49 additional (Emergency and day care beds)	400
Between 20-30 lakh	400 beds+ 60 additional (Emergency and day care beds)	500
More than 30 lakhs	500 beds+55 additional (Emergency and day care beds)	600

Figure 10.2 Distribution of District hospital as per availability of beds (as on 31st March 22)

As per data reported on HMIS in the financial year 2021-22, it can be seen that the number of district hospital having bed strength 100 or less than 100 is 292 at all India level. The number of district hospitals are decreasing with raising number of

bed strength. There are merely 14 district hospitals at all over country having bed strength above 700.

1. **Availability of functional beds in District Hospitals:**

A hospital bed constitutes the primary unit of any hospital infrastructure. The number of functional hospital beds is of fundamental importance to both the patients and staff. This indicator is largely under the control of the state. It refers to hospital beds which are regularly maintained and staffed and immediately available for the care of admitted patients.

This indicator is calculated by dividing the total number of functional beds present in district hospital in a month by the total number of District hospital in the area.

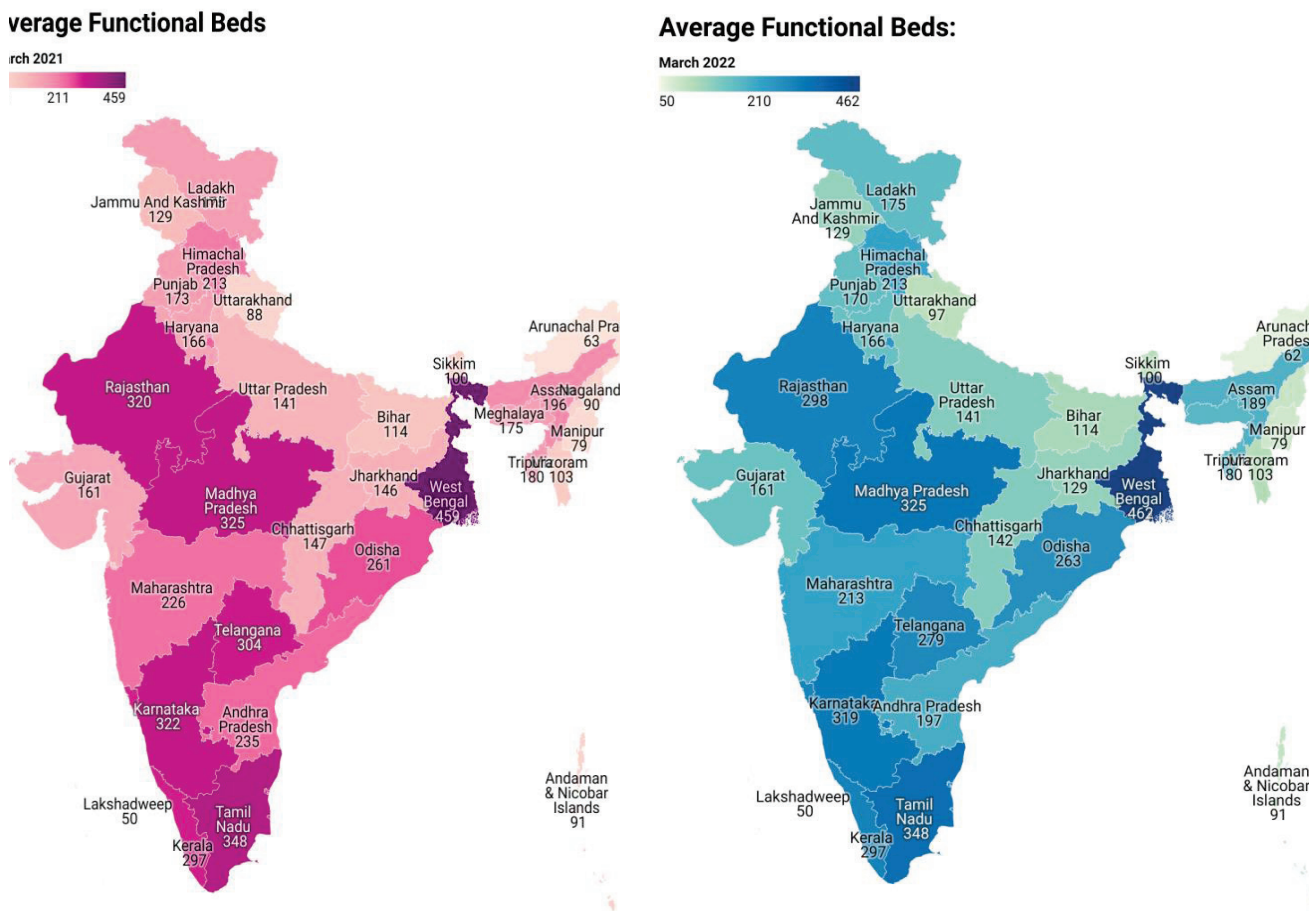

$$\text{Average functional bed availability} = \frac{\text{Total number of functional beds in District hospitals in a month}}{\text{Number of District hospitals}}$$

Significance

- A shortage of available beds can seriously impact functionality of a hospital as it is the primary cause of denial of admission, surgery cancellations, and delays in emergency admissions. Conversely, excess bed capacity may lead to additional costs and stagnant capital.
- Identifying resource allocation, such as requirement of staff, support services, diagnostic testing facilities.

Figure 10.3 shows that average bed availability in the most of the states remains same in both the financial years (2020-21 and 2021-22) except some few states. In the financial 2020-21, average bed availability in Rajasthan and Karnataka was 320 & 322 which decline to 298 and 319 in the financial year 2021-22. Similar decline in the number of average functional availability bed can be seen in Maharashtra, Andhra Pradesh, Chhattisgarh, Telangana, Jharkhand, and Punjab. Moreover, the average bed availability in Madhya Pradesh, Lakshadweep, Tamil Nadu, Haryana, Tripura and Mizoram remains same in both of these financial years.

Figure 10.3 State/UT wise average availability of functional beds in Government District Hospitals during 31st March 2021 and 31st March 2022

2. Bed Occupancy Rate:

Bed occupancy rate helps in determining the efficiency of a district hospital. It reflects efficiency in the use of hospital beds.

The bed occupancy rate is calculated by dividing the total number of inpatients headcounts at midnight added for a year by the number of functional beds available in the District hospital multiplied by 365 days. The ratio is multiplied by 100 to express the figure in percentage. The bed occupancy rate shows the effective utilization of available beds in a hospital.

$$\text{Bed Occupancy Rate} = \frac{\text{Total number of inpatients headcount at midnight added for a year} \times 100}{\text{Total functional beds in District Hospital} \times 365}$$

An optimal bed occupancy rate is between 80 and 85 percent, at which point a facility will run most effectively. According to IPHS recommendations from 2012, district hospitals should have 80% of their beds occupied.

Significance

The bed occupancy rate aids in identifying facilities with the best resource utilization rates from the perspective of public health planning as high bed occupancy rate reflects the good quality of services, infrastructure, trained staff, patient care and satisfaction provided by the facility whereas low bed occupancy rates (<42%) at primary health care level indicated lack of medically trained personnel, sporadic supply of drugs and other medical supplies and a complete breakdown in the transfer and referral system.

- Hospitals cannot operate at 100% occupancy, as spare bed capacity is needed to accommodate variations in demand. Lack of available beds increase delays in emergency departments, cause patients to be placed on clinically inappropriate wards and increase the rate of hospital-acquired infections. This also puts staff under pressure to free up beds that can pose a risk to patient safety.
- Utilizing the indicator, hospitals can evaluate their performance and identify opportunities for development. The reasons for the respective level of utilization can be identified and future decisions can be made based upon this.
- This indicator can be further used for comparison among facilities at the state/region/national level and help to find out their efficiency.

The below **figure no 10.4** shows the bar graph which compares the bed occupancy rates of all states in the financial year 2020-21 and 2021-22. The red highlighted bars represent the states having bed occupancy rate less than the national average (which is highlighted in green colour) whereas blue colour horizontal bars represent the states having bed occupancy rate higher than the national average.

The given chart shows that there are overall 26 states which has bed occupancy rate lower than the national average. It can be clearly seen that, in the both the financial years, Arunachal Pradesh and Andaman and Nicobar Island have lowest bed occupancy rate whereas Odisha has highest bed occupancy rate in both these financial years (2020-21 & 2021-22).

Figure 10.4 State/UTs wise comparison of average bed occupancy rate in Govt. District Hospitals during financial year 2020-21 and 2021-22

3. C-section rate:

A caesarean section is a form of childbirth in which a surgical incision is made through mother's abdomen and uterus into deliver one or more babies. It was introduced in clinical practice as a lifesaving procedure both for the mother and the baby. C-section deliveries are absolutely critical to save lives in situations where vaginal deliveries would pose risks, so all health systems must ensure timely access for all women when needed.

C-section rate is calculated by dividing the number of Caesarean section deliveries performed in a year with the total number of deliveries in the year. The figure is multiplied by 100 in order to express it in percentage.

$$\text{C-section rate} = \frac{\text{Number of C-section deliveries performed in the year}}{\text{Total number of deliveries in the year (Normal + Assisted Deliveries + C Section)}} \times 100$$

The cases that come to district hospitals are often emergency or complicated cases. A surgical procedure cannot be avoided in such cases. As per the **WHO report, "At population level, C-section rates higher than 10% are not associated with reductions in maternal and new born mortality rates.** A district hospital would receive multiple complicated cases of pregnancy that require performing C-section surgery. The WHO states that every effort should be made to provide caesarean sections to women in need, rather than striving to achieve a specific rate.

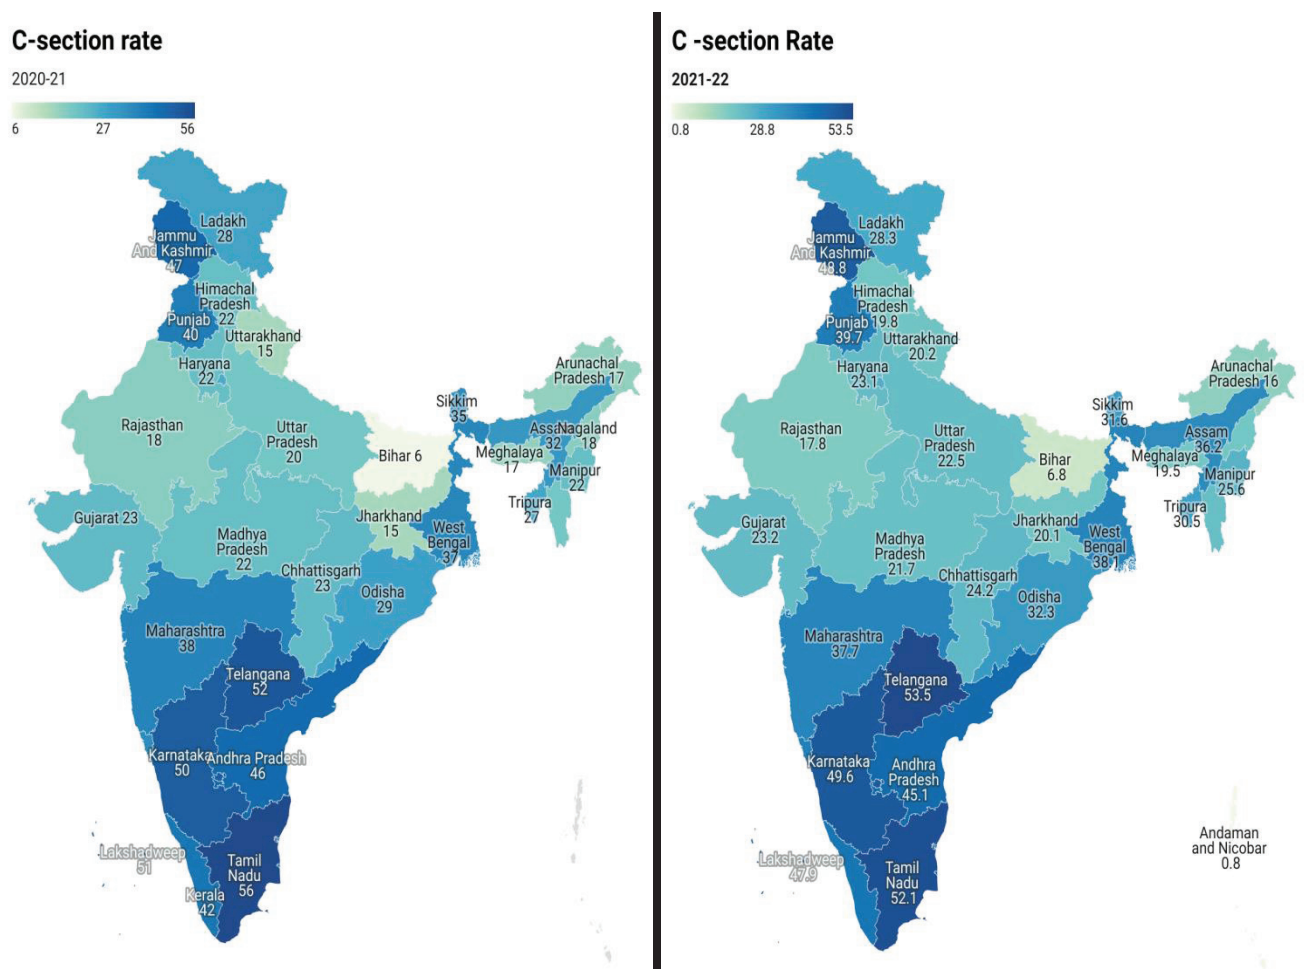

Significance

- C-section deliveries are absolutely critical to save lives in situations where vaginal deliveries would pose risks, so all health systems must ensure timely access for all women when needed.
- Both extremely low and extremely high rates of C-section deliveries pose adverse effects within maternal health care, and therefore, observing the trend of the C-section rate is crucial in identifying its reasons.
- C-section deliveries are associated with longer hospital stays, delayed initiation of breastfeeding and higher out-of-pocket expenses due to longer duration of stay.
- A high rate of C-section deliveries can be associated with both short- and long-term risks which can extend for many years beyond the current delivery and affect the health of the woman, her child, and future pregnancies.

The below map depicts the comparative analysis of C-section rate in all states of the country in the financial year 2020-21 and 2021-22. In the financial year 2020-21, C-section rate at national level was around 27% which rose to 28.8% in the next financial year 2021-22.

Overall, in the financial year 2021-22, C-section rate has increased in the most of the Indian states except some states such as Rajasthan, Tamil Nadu, Himachal Pradesh and Punjab. Furthermore, Bihar and Andaman and Nicobar island have lowest C-section rate in the both the financial years whereas Tamil Nadu has highest C-section rate (56%) in the financial year 2020-21 and Telangana (53.5%) has highest C –section rate in the financial year 2021-22.

Figure 10.5 Average percentage of C-section deliveries in Govt. district hospital of State/UTs during financial year 2020-21 and 2021-22

4. Rate of early initiation of breastfeeding:

Early initiation of breastfeeding, within one hour of birth, protects the new-born from acquiring infection and reduces new-born mortality. It facilitates emotional bonding of the mother and the baby and has a positive impact on duration of exclusive breastfeeding. When a mother initiates breastfeeding within one hour after birth, production of breast milk is stimulated. The yellow or golden first milk produced in the first days, also called colostrum, is an important source of nutrition and immune protection for the new-born.

The rate of early initiation of breastfeeding is calculated by dividing the total number of

new-borns breastfeed within 1 hour of birth by total number of live births. The figure is multiplied by 100 in order to express it in percentage.

$$\text{Rate of early initiation of breastfeeding} = \frac{\text{Total no. of new-borns breastfeed within 1 hr of birth}}{\text{Total number of live births}} \times 100$$

Significance

- Early initiation of breastfeeding has different health benefits like increase ability to defense infections, reduce the risk of diarrhea, and increase the survival rate of children.
- Neonatal mortality can be prevented by 33% if early initiation of breastfeeding is practiced by mothers.

The below bar graph compares the rate of initiation of breastfeeding in all states of the country in the financial year 2020-21 and 2021-22. As seen from the graph, the red highlighted bars represent the states having rate of initiation of breastfeeding lower than the national average. The national average of (which is highlighted in green color) rate of initiation of breastfeeding is 89.6 and 90 percent in the financial year 2020-21 and 2021-22. The states having rate of initiation of breastfeeding is higher than the national average is represented by blue color.

From the figure no 10.6 it is clearly seen that, Delhi has the lowest rate of initiation of breastfeeding while Lakshadweep and Mizoram has highest rate of breastfeeding in the financial year 2020-21.

Figure 10.6 Average rate of early initiation of breastfeeding in public district hospitals of State/UTs during the financial year 2020-21 and 2021-22

5. Blood Bank Replacement Rate

In this indicator, blood units issued in a year includes voluntary donation replacement. Number of blood units issued on replacement donation means that a patient's attendant is being asked to give blood units, for getting blood from the blood bank. Replacement needs to be phased out as the replacement donor has a chance of higher sero-positivity (giving a positive result in a test of blood serum, e.g. for the presence of a virus.)

It is calculated by dividing the total number of blood units issued on replacement in the year by the total number of blood units issued in that year and then multiplied by 100.

This indicator has negative valence, implying that lower the score, better the performance.

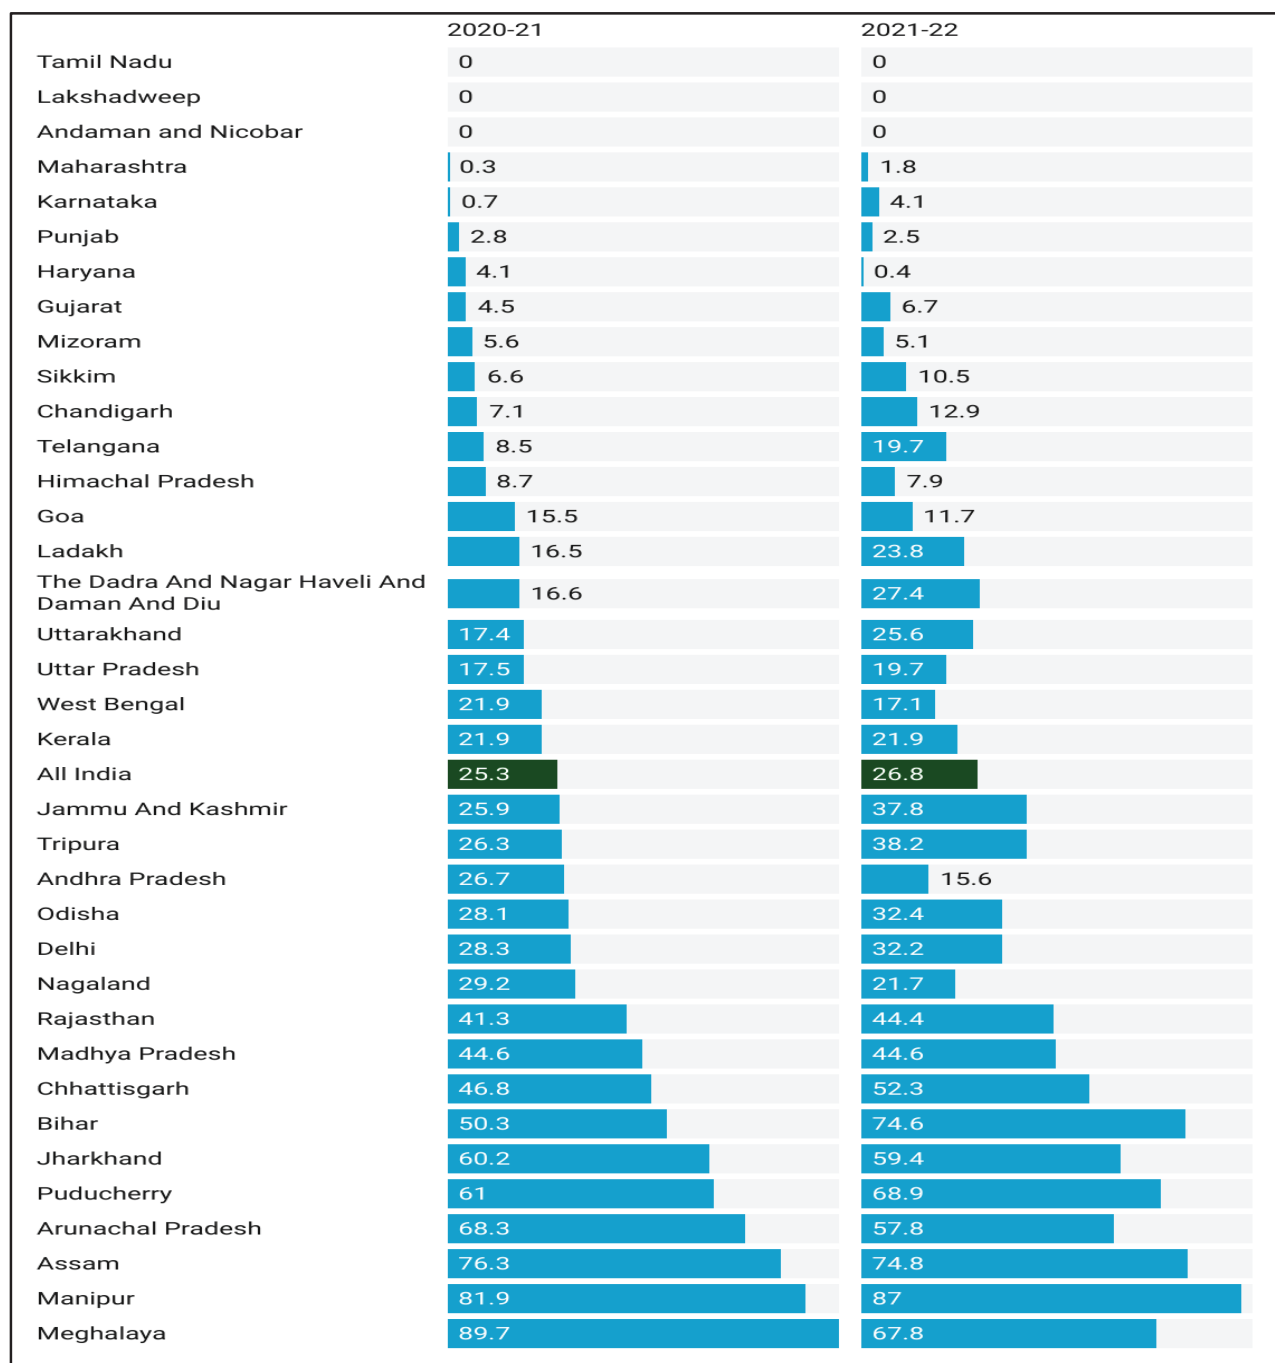

$$\text{Blood bank replacement rate} = \frac{\text{Total number of blood units issued on replacement in the year}}{\text{Total number of blood units issued in year}} \times 100$$

This indicator measures the ability of the hospital to provide as well as manage the supply of blood from low-risk donors.

Significance

- This indicator measures the ability of the hospital to provide as well as manage the supply of blood from low-risk donors.
- This indicator helps in identifying how much voluntary replacements are made and how many are paid. In an ideal situation the blood bank should be replenished with voluntary donations rather than asking the patient's caretakers to replace the blood units being issued to the patient.
- This indicator is to encourage voluntary donations and maintain a replenished blood bank. The spirit is not to refuse blood units by the patients' caretakers when issued, but also not insist upon replacing the blood units issued.

Figure 10.7: Average blood replacement rate in Govt. district hospitals of States/UTs during the financial year 2020-21 and 2021-22

The above chart reflects the blood replacement rate of all states in the financial year 2020-21 and 2021-22. Overall, there are 20 states /UTs which have blood replacement lower than the national average.

The national average of blood replacement in the financial year 2020-21 was 25.3% which rose to 26.8% in the next financial year 2021-22 which indicates blood replacement score going downwards. In Andaman and Nicobar islands for this indicator there was no data reported on HMIS portal.

Apart of this, as per reported data on HMIS, Tamil Nadu state is performing quite impressive in this indicator. As in the financial year 2020-21, 30,294 blood units and in the financial year 2021-22, 34,477 blood units are issued by Govt. district hospitals but in replacement they have zero reported data.

6. Surgeries

Surgery is the branch of medicine that deals with the physical manipulation of bodily structure to diagnose, prevent or cure diseases. Due to increase in traumatic injuries, cancers, and many other diseases, surgical interventions on public health systems are also growing. Also at many instances, surgeries are the only intervention that alleviates disabilities and reduce the risk of deaths from various ailments.

Generally the patients are referred to District Hospitals or FRUs for surgical treatment related to trauma, obstetric, abdominal, orthopedic emergencies etc. Therefore, surgical department should have surgical specialists available in these facilities for providing quality of surgical and acute care to patients. If there is, unavailability of apparatus, drugs, and various other essential supplies, it limits the good quality of surgical care.

Overall 32 lakh surgeries were performed in financial year 2020-21 which rose to 37 lakh in next financial year 2021-22. The graph given below compares the operation major, operation minor and C –section surgeries performed during the financial year 2020-21 and 2021-22.

Figure 10.8 Average Percentage of various surgeries conducted at govt. district hospitals across all over the country during the financial year 2020-21 and 2021-22

It can be seen from the graph that there is a slight change in the proportion of surgeries performed during the financial year 2020-21 and 2021-21. In the financial year 2020-21 , 56% surgeries comes under operation minor and the rest 21% and 23% comes under C section and operation major. In the next financial year 2021-

22, proportion of operation minor and operation major reaches to 57% and 24% whereas the percentage of C section during performed decline from 21% to 19% during the financial year 2020-21.

7. **Post-surgical site infection**

Surgical site infection (SSI) is an infection related to an operative procedure that occurs at or near the surgical incision within 30 days of the procedure, or within 90 days if prosthetic material is implanted at surgery. Sometimes be superficial infections involving the skin only. Other surgical site infections are more serious and can involve tissues under the skin, organs, or implanted material.

It is calculated by dividing total number of cases developed surgical site infection to total surgeries performed. The figure is multiply by 100.

$$\text{Post-surgical site infection} = \frac{\text{Total number of cases developed SSI}}{\text{Total surgeries performed}} \times 100$$

In total surgeries addition of operation major, operation minor and C section surgeries is done as SSI can develop also after C-section delivery.

Significance-

- SSIs occur in 2% to 4% of all patients undergoing inpatient surgical procedures. Risk factors for SSI include patient factors (such as age, tobacco use, diabetes, and malnutrition) and procedure-specific risk factors (including emergency surgery and the degree of bacterial contamination of the surgical wound at the time of the procedure).
- SSIs remain a significant cause of morbidity and mortality after surgery. They are the leading cause of readmissions to the hospital following surgery, and approximately 3% of patients who contract an SSI will die as a consequence.

The below chart shows the average percentage of post-surgical infection in the all states/UTs of the country during the financial year 2020-21 and 2021-22. The national average (highlighted green bar) for post-surgical infection rate in the financial year 2020-21 is 0.34% which rose to 0.4 % in the next financial year 2021-21. The lowest post infection rate is found in Manipur and Lakshadweep in the financial year 2020-21.

Figure 10.9 Average Percent of post-surgical infection in Govt. district hospital of State/UTs during the financial year 2020-21 and 2021-22

Conclusion

District hospitals cater to a wide spectrum of the population, including people from neighbouring states and districts, depending on its ease of accessibility. The service delivery, maintenance of records and accurate data reporting are equally important to assess the performance of the hospitals and analyse their outputs and outcomes.

District hospitals that had adopted digitized data reporting formats and had a dedicated staff to monitor data not only fared better in the performance assessment but also were able to utilize the data for internal decision-making and output improvement.

Based on the analysis of these health indicators, among bigger states, bed occupancy rate was highest in Odisha in both the financial year (2020-21 & 2021-22), and in smaller states and UTs Tripura and Ladakh were highest bed occupancy rate. Moving towards the lowest performing states in bed occupancy rates were Jammu & Kashmir, Arunachal Pradesh and Andaman and Nicobar islands among the bigger, smaller states and UTs for both the financial years (2020-21 & 2021-22).

Considering C –section rate among bigger states, Tamil Nadu conducted 56% and 52% in the financial year 2020-21 and 2021-22 which the highest percentage of C –section rate in the bigger states. In smaller states and UTs, Goa and Lakshadweep conducted highest percentage of C –section in-comparison to other smaller states and UTs.

Apart of this, in Blood replacement rate, among bigger states, Tamil Nadu was the ideal state for blood replacement rate during both these financial year (2020-21 & 2021-22) and in UTs, Chandigarh (7.1% in financial year 2020-21 & 12.9% in financial year 2021-22) and in smaller states, Mizoram (5.6% in financial year 2020-21 & 5.1% in financial year 2021-22) performed best in terms of blood replacement rate.

Furthermore, the performance of UTs in rate of initiation of breastfeeding is quite impressive during these financial years. All UTs have breastfeeding rate higher than 90%. Additionally, among bigger states of the country, the rate of initiation of breastng in one hour was lowest in Govt. district hospital of Delhi and highest in Govt. district hospitals of Kerala during the whole financial year of 2020-21 & 2021-22. In smaller states, Manipur has highest rate of initiation of breastfeeding in both the financial years.

As far as post-surgical infection rate is concerned, all Govt. district hospitals were performing well except Andaman and Nicobar Islands, Sikkim, Karnataka and Madhya Pradesh. The district hospitals should have work more to reduce the surgical site infection.

Annexure 10.1

Number of district hospitals as on 31st March 2022

State	No of District hospitals
Andaman & Nicobar Islands	2
Andhra Pradesh	7
Arunachal Pradesh	19
Assam	27
Bihar	36
Chandigarh	2
Chhattisgarh	27
Delhi	40
Goa	2
Gujarat	20
Haryana	22
Himachal Pradesh	9
